

Rubber- or plastics-coated fabrics – Measurement of gas permeability

WARNING — Persons using this International Standard should be familiar with normal laboratory practice. This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user to establish appropriate safety and health practices and to ensure compliance with any national regulatory conditions.

1 Scope

This International Standard specifies a method of measuring gas transmission through fabrics coated with plastic or rubber, a property known as permeability.

It is particularly applicable

- when the anticipated permeability is less than $3 \text{ dm}^3/(\text{d}\cdot\text{m}^2)$ (cubic decimetres per day per square metre);
- when particular temperature or pressure conditions are required;
- when the measurement requires the use of particular gases, either in the pure state or as a mixture.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 2231:1989, *Rubber- or plastics-coated fabrics — Standard atmospheres for conditioning and testing*.

ISO 2286 1: ¹⁾, *Rubber or plastic coated fabrics — Determination of roll characteristics — Part 1: Method for determination of the length, width and net mass of a roll*.

ISO 3601-1:1988, *Fluid systems — Sealing devices — O-rings — Part 1: Inside diameters, cross-sections, tolerances and size identification code*.

3 Principle

A test piece is placed between two parts of a hermetically sealed measurement cell. One surface of the test piece, chosen for convenience, is subjected to the constant pressure of a tracer gas while the other is in contact with a vector gas flowing at a constant rate into the cell. An analyser system at the cell outlet measures the concentration of the tracer gas in the vector gas, from which the permeability of the test piece to the tracer gas is then determined.

1) To be published. (Revision, in parts, of ISO 2286:1986)
