## Photosynthesis

### KEY CONCEPTS

- 10.1** Photosynthesis converts light energy to the chemical energy of food
- 10.2** The light reactions convert solar energy to the chemical energy of ATP and NADPH
- 10.3** The Calvin cycle uses the chemical energy of ATP and NADPH to reduce  $\text{CO}_2$  to sugar
- 10.4** Alternative mechanisms of carbon fixation have evolved in hot, arid climates

a. Other organisms also benefit from photosynthesis.

### The Process That Feeds the Biosphere

**L**ife on Earth is solar powered. The chloroplasts in plants and other photosynthetic organisms capture light energy that has traveled 150 million kilometers from the sun and convert it to chemical energy that is stored in sugar and other organic molecules. This conversion process is called **photosynthesis**. Let's begin by placing photosynthesis in its ecological context.

Photosynthesis nourishes almost the entire living world directly or indirectly. An organism acquires the organic compounds it uses for energy and carbon skeletons by one of two major modes: autotrophic nutrition or heterotrophic nutrition. **Autotrophs** are "self-feeders" (*auto-* means "self," and *trophos* means "feeder"); they sustain themselves without eating anything derived from other living beings. Autotrophs produce their organic molecules from  $\text{CO}_2$  and other inorganic raw materials obtained from the environment. They are the ultimate sources of organic compounds for all nonautotrophic organisms, and for this reason, biologists refer to autotrophs as the *producers* of the biosphere.

Almost all plants are autotrophic; the only nutrients they require are water and minerals from the soil and carbon dioxide from the air. Specifically, plants are *photoautotrophs*, organisms that use light as a source of energy to synthesize organic substances (**Figure 10.1**). Photosynthesis also occurs in algae, certain other

The common fig *Ficus carica* L is one of the oldest fruits domesticated by humans and is native to southwest Asia and the Mediterranean. Figs have been associated with health and prosperity since ancient times. They are rich in fibre, potassium, calcium and iron, as well as being an important source of vitamins, amino acids and antioxidants. In recent years, increased consumption has caused fig production to shift to new countries such as Mexico, Brazil, India and China. However, fig is a challenging fruit crop to grow. It is susceptible to insect pests and diseases, as well as injuries from abiotic stress during fruit development and ripening. As a delicate fruit, it also requires complicated postharvest procedures, and climate change presents additional challenges. This volume serves as a comprehensive reference for current and future practices of fig production, consumption, research and innovation, and is essential for academic researchers and those involved in research and development in the fig industry.
