Computation of Viscous Incompressible Flows Dochan Kwak, Cetin C. Kiris, 2010-12-14 This monograph is intended as a concise and self contained guide to practitioners and graduate students for applying approaches in computational fluid dynamics CFD to real world problems that require a quantification of viscous incompressible flows In various projects related to NASA missions the authors have gained CFD expertise over many years by developing and utilizing tools especially related to viscous incompressible flows They are looking at CFD from an engineering perspective

which is especially useful when working on real world applications From that point of view CFD requires two major elements namely methods algorithm and engineering physical modeling As for the methods CFD research has been performed with great successes In terms of modeling simulation mission applications require a deeper understanding of CFD and flow physics which has only been debated in technical conferences and to a limited scope This monograph fills the gap by offering in depth examples for students and engineers to get useful information on CFD for their activities The procedural details are given with respect to particular tasks from the authors field of research for example simulations of liquid propellant rocket engine subsystems turbo pumps and the blood circulations in the human brain as well as the design of artificial heart devices However those examples serve as illustrations of computational and physical challenges relevant to many other fields Unlike other books on incompressible flow simulations no abstract mathematics are used in this book Assuming some basic CFD knowledge readers can easily transfer the insights gained from specific CFD applications in engineering to their area of interest

ISSA Handbook, 1991 *Shipboard Acoustics* J. Buiten, 2012-12-06 The first International Symposium on Shipboard Acoustics held in Noordwijkerhout The Netherlands in 1976 was a meeting of invited experts each having considerable expertise in ship acoustics Many of the participants were dealing with research on various ship acoustical subjects and it proved to be a good idea to discuss future investigations and new techniques At that time acousticians learned to use real time signal processing techniques and attempts were made to establish sound level prediction methods based on semi fundamental considerations instead of the methods using empirically obtained data Time was pressing as it was assumed that in view of the adoption of Recommendation 141 of the International Labour Conference in 1970 authorities would soon make appropriate provisions to protect seafarers from the ill effects of noise This resulted in several national recommendations followed by the IMO Code on noise levels aboard ships which was adopted by the IMO Assembly in 1981 After that pressure on the authorities was increased further by the decision of the European Community to protect labourers against harmful noise at their workplaces including ships Legally enforceable noise limits will therefore become normal in the future In many countries recommendations with respect to maximum allowable sound pressure levels in the crew accommodations and work area aboard ships were already taken into account by ship owners long before the existence of the Recommendations
