**General and Specific Mental Abilities** Dennis J. McFarland, 2020-05-07 The history of testing mental abilities has seen the dominance of two contrasting approaches: psychometrics and neuropsychology. These two traditions have different theories and methodologies but overlap considerably in the tests they use. Historically, psychometrics has emphasized the primacy of a general factor while neuropsychology has emphasized specific abilities that are dissociable. This issue about the nature of human mental abilities is important for many practical concerns. Questions such as gender, ethnic, and age-related differences in mental abilities are relatively easy to address if they are due to a single dominant trait. Presumably, such a trait can be measured with any collection of complex cognitive tests. If there are many specific mental abilities, these would be much harder to measure, and associated social issues would be more difficult to resolve. The relative importance of general and specific abilities also has implications for educational practices. This book includes the diverse opinions of experts from several fields, including psychometrics, neuropsychology, speech, language, and hearing, and applied psychology.
