illustrates the importance of this book's elaborate coverage of cardiovascular physiology by the application of mathematical and computational methods. This book has literally transformed Cardiovascular Physiology into a STEM discipline involving i) quantitative formulations of heart anatomy and physiology ii) technologies for imaging the heart and blood vessels iii) coronary stenosis hemodynamics measure by means of fractional flow reserve and intervention by grafting and stenting iv) fluid mechanics and computational analysis of blood flow in the heart aorta and coronary arteries and v) design of heart valves percutaneous valve stents and ventricular assist devices. So how is this mathematically and computationally configured landscape going to impact cardiology and even cardiac surgery? We are now entering a new era of mathematical formulations of anatomy and physiology leading to technological formulations of medical and surgical procedures towards more precise medicine and surgery. This will entail reformatting of i) the medical MD curriculum and courses so as to educate and train a new generation of physicians who are conversant with medical technologies for applying into clinical care as well as ii) structuring of MD PhD Computational Medicine and Surgery Program to train competent medical and surgical specialists in precision medical care and patient specific surgical care. This book provides a gateway for this new emerging scenario of i) science and engineering based medical educational curriculum and ii) technologically oriented medical and surgical procedures. As such, this book can be usefully employed as a textbook for courses in i) cardiovascular physiology in both the schools of engineering and medicine of universities as well as ii) cardiovascular engineering in biomedical engineering departments worldwide.
