Automatic Assessment of Children Speech to Support Language Learning Christian Hacker, 2009 Focus of this work are pattern recognition related aspects of computer assisted pronunciation training CAPT for second language learning An overview of commercial systems shows that pronunciation training is being addressed by the growing field of computer assisted language learning only to a small extend although in the state of the art section a number of such approaches for automatic assessment can already be presented In the present thesis different approaches are extended and combined In particular a large set of nearly 200 pronunciation and prosodic features is developed By this approach pronunciation scoring is regarded as classification task in high dimensional feature space Automatic speech recognition is the basis of most pronunciation scoring algorithms In this thesis a system is presented which supports second language learning at school i e the target users are children For this reason a state of the art speech recognition engine is adapted to children speech since young speakers are only hardly recognised by automatic systems Phonetically motivated rules for typical mispronunciation errors are integrated into the system to make it suitable for pronunciation scoring Evaluating an algorithm for pronunciation assessment is more difficult than simply counting the correctly recognised mistakes since there exists no objective ground truth This can be shown by evaluating the annotations of 14 teachers However with different measures it can be verified that the accuracy of the system in comparison with teachers thoroughly reaches the agreement among teachers The evaluation is conducted with native German speakers learning English
