Sound, Music and Movement in Parkinson's Disease Marta M. N. Bieńkiewicz, Cathy Craig, 2017-01-05 Recent years have brought new insights to the understanding of Parkinson's disease impact of exercise and sound displays in rehabilitation and movement facilitation There is growing evidence that auditory signals in the environment can provide a temporal template for movement and change the mode of motor control from

intrinsic to extrinsic habitual to goal directed enabling enhanced motor performance in patients In addition forced exercise rate studies show that exercising at the pace of healthy adults can have potential neuroprotective benefits for patients Many research groups have explored the use of auditory cues such as rhythmical auditory training in improving gait and upper limb movement parameters Cues are usually either intermittent metronome or continuous dynamic sound displays Similarly dance based interventions suggest that patients benefit from additional sensory information i e the temporal structure embedded in music and proprioceptive information from a dancing partner that facilitates movement On the contrary studies dedicated to auditory perception and motor timing report an impaired ability of patients to perceive and synchronise with complex rhythmical structures i e causing an inability to play musical instruments With the growth of modern technology and the increasing portability of hi specification devices such as smart phones new research questions on the design of interventions are beginning to emerge as we strive for more efficient therapeutic approaches In this Research Topic we wanted to bring together top scientists from the movement disorder motor control and sound related studies along with therapists That way we can engage in cross disciplinary and challenging scientific debate about future rehabilitation avenues and frontiers for Parkinson s disease patients

Neurociência e música
MARIA JOSÉ DA SILVA FERNANDES, VIVIANE LOURO, 2024-05-03 H quem diga que ciência e arte são opostas ou não se

misturam uma mensurável a outra intuitiva uma lógica a outra abstrata. Ser mesmo. Se nosso cérebro tudo observa, interpreta, cria, sistematiza, assimila e executa, não seriam arte e ciência produtos de um mesmo radical. Os muitos cientistas não foram criados por cérebros criativos. Muitos muitos cientistas surgiram de forma intuitiva e passaram por muita improvisação antes de serem sistematicamente organizados. Operar precisamente um tumor cerebral não seria tão belo e perigoso quanto fazer uma acrobacia numa corda bamba. Ou conseguir organizar o código genético não seria tão complexo e profundo quanto organizar os sons em uma sinfonia. Logo não seria a ciência uma arte. Uma partitura não a sistematiza o de um conhecimento de forma que este possa ser replicado em qualquer lugar do mundo. Portanto não seria a arte de certa forma também uma ciência na perspectiva de que somos seres integrais e plurais que este livro foi elaborado com o intuito de abordar um tema ainda pouco visitado a relação da música com o cérebro. A neurociência visa estudar o sistema nervoso humano no que tange arquitetura, redes, sinápticas, vias, metabolismo etc e seu funcionamento em relação aprendizagem, comportamento e patologias. Tem se tornando uma área presente que dialoga com muitas outras: arqueologia, educação, marketing, design, nutrição, cinema, psicologia, música dentre outras. A música nos acompanha desde as proto-civilizações. Somos seres musicais além de linguísticos, diz o neurologista Oliver Sacks em seu livro *Alucinações Musicais*. Ou seja, nosso sistema nervoso passou por adaptações ambientais e genéticas no decorrer do desenvolvimento como espécie que nos permitiram ter um aparato neurológico capaz de compreender, criar e executar funções refinadas estando a música em primeiro lugar nessa complexidade cognitivo-emocional e motora. Por tudo isso a neurociência vem a cada dia mais se interessando em compreender como e por que esse fenômeno chamado música tem tanta influência em nosso cérebro.

The Routledge Companion to Applied Musicology brings together academics, artist-researchers and practitioners to provide readers with an extensive and authoritative overview of applied musicology. public oriented musicologies These rapid advances have created a fast changing field whose scholarship and activities tend to take place in isolation from each other This volume addresses that shortcoming bringing together a wide ranging survey of current approaches Featuring 39 authors The Routledge Companion to Applied Musicology falls into five parts Defining and Theorising Applied Musicology Public Engagement New Approaches and Research Methods Representation and Inclusion and Musicology in for Performance that chronicle the subject s rich history and consider the connections that will characterise its future The book offers an essential resource for anyone exploring applied musicology Dialogues in Music Therapy and Music Neuroscience: Collaborative Understanding Driving Clinical Advances Julian O'Kelly,Jörg C. Fachner,Mari Tervaniemi,2017-06-30 Music is a complex dynamic stimulus with an unparalleled ability to stimulate a global network of neural activity involved in attention emotion memory communication motor co ordination and cognition As such it provides neuroscience with a highly effective tool to develop our understanding of brain function connectivity and plasticity Increasingly sophisticated neuroimaging technologies have enabled the expanding field of music neuroscience to reveal how musical experience perception and cognition may support neuroplasticity with important implications for the rehabilitation and assessment of those with acquired brain injuries and neurodegenerative conditions Other studies have indicated the potential for music to support arousal attention and emotional regulation suggesting therapeutic applications for conditions including ADHD PTSD autism learning disorders and mood disorders In common with neuroscience the music therapy profession has advanced significantly in the past 20 years Various interventions designed to address functional deficits and health care needs have been developed alongside standardised behavioural assessments Historically music therapy has drawn its evidence base from a number of contrasting theoretical frameworks Clinicians are now turning to neuroscience which offers a unifying knowledge base and frame of reference to understand and measure therapeutic interventions from a biomedical perspective Conversely neuroscience is becoming more enriched by learning about the neural effects of real world clinical applications in music therapy While neuroscientific imaging methods may provide biomarking evidence for the efficacy of music therapy interventions it also offers important tools to describe time locked interactive therapy processes and feeds into the emerging field of social neuroscience Music therapy is bound to the process of creating and experiencing music together in improvisation listening and reflection Thus the situated cognition and experience of music developing over time and in differing contexts is of interest in time series data We encouraged researchers to submit papers illustrating the mutual benefits of dialogue between music therapy and other disciplines important to this field particularly neuroscience neurophysiology and neuropsychology The current eBook consists of the peer reviewed responses to our call for papers
