Lipids in Health and Disease Peter Quinn, Xiaoyuan Wang, 2008-08-27 Lipids are functionally versatile molecules They have evolved from relatively simple hydrocarbons that serve as depot storages of metabolites and barriers to the permeation of solutes into complex compounds that perform a variety of signalling functions in higher organisms This volume is devoted to the polar lipids and their constituents We have omitted the neutral lipids like fats and oils because their function is generally to act as deposits of metabolizable substrates The sterols are also outside the scope of the present volume and the reader is referred to volume 28 of this series which is the subject of cholesterol The polar lipids are comprised of fatty acids attached to either glycerol or sphingosine The fatty acids themselves constitute an important reservoir of substrates for conversion into families of signalling and modulating molecules including the eicosanoids amongst which are the prostaglandins thromboxanes and leucotrienes The way fatty acid metabolism is regulated in the liver and how fatty acids are desaturated are subjects considered in the first part of this volume This section also deals with the modulation of protein function and inflammation by unsaturated fatty acids and their derivatives New insights into the role of fatty acid synthesis and eicosenoid function in tumour progression and metastasis are presented

Aging, neurogenesis and neuroinflammation in hearing loss and protection Marta Magariños, Marta Milo, Isabel Varela-Nieto, 2015-09-29 Worldwide 278 million people are estimated to have moderate to profound hearing loss Age related hearing loss also known as presbycusis affects approximately half of the population over 60 years old making it the second most common cause of disability in older people Hearing loss occurs when the sensory cells and neurons of the cochlea degenerate and die The vestibular system which holds the sense of balance

shares a common embryonic origin with the cochlea and together conform the inner ear Balance problems are a trait of ageing to the point that balance ability is considered a sensor of physical decline and vestibular degeneration is the most common cause of falls in the elderly Still the molecular bases of ageing in the vestibular system have not been studied in detail Genetic and environmental factors contribute to the progression of age related hearing loss ARHL Being noise the main environmental noxious agent for human hearing in the industrialized societies There is no restorative treatment for deafness but functional replacement by means of prosthesis Therefore prevention and treatment of hearing loss is an unmet medical need To develop innovative medical strategies against hearing loss it is critical to understand the causes of ARHL and the essential pathways responsible for the manifestation of this complex disease In this research topic experts will discuss the stages and molecular elements of the damage and repair processes involved in ARHL from cellular processes to molecules involved in aging Oxidative stress takes a central stage as an essential element in the progression of injury and cell loss and a target for cell protection strategies Finally the mechanisms of action and the potential of novel therapies for hair cell repair and protection will be discussed along with drug delivery strategies *Sphingolipids* Gerhild van

Echten-Deckert, 2021-08-30 Although sphingolipids are ubiquitous components of cellular membranes their abundance in cells is generally lower than glycerolipids or cholesterol representing less than 20% of total lipid mass Following their discovery in the brain which contains the largest amounts of sphingolipids in the body and first description in 1884 by J L W Thudichum sphingolipids have been overlooked for almost a century perhaps due to their complexity and enigmatic nature When sphingolipidoses were discovered a series of inherited diseases caused by enzyme mutations involved in sphingolipid degradation returned to the limelight The essential breakthrough came decades later in the 1990s with the discovery that sphingolipids were not just structural elements of cellular membranes but intra and extracellular signaling molecules It turned out that their lipid backbones including ceramide and sphingosine 1 phosphate had selective physiological functions Thus sphingolipids emerged as essential players in several pathologies including cancer diabetes neurodegenerative disorders and autoimmune diseases The present volume reflects upon the unexpectedly eclectic functions of sphingolipids in health disease and therapy This fascinating lipid class will continue to be the subject of up and coming future discoveries especially with regard to new therapeutic strategies **Cumulated Index Medicus**, 1990 **Phospholipases in Health**

and Disease Paramjit S. Tappia, Naranjan S. Dhalla, 2014-03-13 Phospholipases generate lipid signaling molecules through their hydrolytic action on phospholipids and are known to regulate function of a variety of cells under normal and diseased conditions While several physiological biochemical and molecular techniques have identified key players involved in different disease processes phospholipases have also emerged as critical players in the pathogenesis of a number of different diseases including cancer and heart disease In addition phospholipases are also implicated in such conditions as brain disorder injury kidney and immune cell dysfunction *Phospholipases in Health and Disease* is a compilation of review articles dedicated to the

study of the field with respect to biochemical and molecular mechanisms of normal and abnormal cell function The wide range of area covered here is of interest to basic research scientists clinicians and graduate students who are engaged in studying pathophysiological basis of a variety of diseases Furthermore this book highlights the potential of the different phospholipases as therapeutic targets as well as part of prevention strategies Twenty three articles in this book are organized in four sections that are designed to emphasize the most characterized forms of the phospholipases in mammalian cells The first section discusses general aspect of phospholipases Section two covers the role and function of phospholipase A in different pathophysiological conditions The third section is focussed on phospholipase C which is believed to play a central role in transmembrane signaling The final section covers phospholipase D which is present in a variety of different cells The book illustrates that the activation of phospholipases is of fundamental importance in signal transduction affecting cell function Overall this book discusses the diverse mechanisms of phospholipase mediated signal transduction in different pathophysiological conditions and raises the possibility of specific forms of phospholipases serving as novel targets for drug development

Embryonic Stem Cells Michael S. Kallos,2011-10-12 The ultimate clinical implementation of embryonic stem cells will require methods and protocols to turn these unspecialized cells into the fully functioning cell types found in a wide variety of tissues and organs In order to achieve this it is necessary to clearly understand the signals and cues that direct embryonic stem cell differentiation This book provides a snapshot of current research on the differentiation of embryonic stem cells to a wide variety of cell types including neural cardiac endothelial osteogenic and hepatic cells In addition induced pluripotent stem cells and other pluripotent stem cell sources are described The book will serve as a valuable resource for engineers scientists and clinicians as well as students in a wide range of disciplines
