McRoberts,2009-12-02 Forest inventories throughout the world have evolved gradually over time The content as well as the concepts and definitions employed are constantly adapted to the users needs Advanced inventory systems have been established in many countries within Europe as well as outside Europe as a result of development work spanning several decades in some cases more than 100 years With continuously increasing international agreements and commitments the need for information has also grown drastically and reporting requests have become more frequent and the content of the reports wider Some of the agreements made at the international level have direct impacts on national economies and international decisions e g the Kyoto Protocol Thus it is of utmost importance that the forest information supplied is collected and analysed using sound scientific principles and that the information from different countries is comparable European National Forest Inventory NFI teams gathered in Vienna in 2003 to discuss the new challenges and the measures needed to get data users to take full advantage of existing NFIs As a result the European National Forest Inventory Network ENFIN a network of NFIs was established The ENFIN members decided to apply for funding for meetings and collaborative activities COST European Cooperation in Science and Technology provided the necessary financial means for the realization of the program Managing Forest Ecosystems: The Challenge of Climate Change Felipe Bravo,Valerie LeMay,Robert Jandl,2017-04-03 Climate change shaped the political agenda during the last decade with three issues as hot topics commonly making the headlines carbon budgets impact and mitigation of climate change Given the significant role that forests play in the climate system as sources sinks and through carbon trading this book update the current scientific evidences on the relationships between climate forest resources and forest management practices around the world By including the forest scientists expertise from around the world the book presents and updates a depth analysis of the current knowledge and a series of case studies focused on the biological and the economic impacts of climate change in forest ecosystems in Africa Asia Europe and North and South America The book will form a valuable resource for researchers and advanced students dealing with sustainable forestry climate change issues and the effects of climate change on natural resource management Microbial genomics challenge Darwin Didier Raoult,Eugene V. Koonin, The 200th anniversary of Darwin's birthday was celebrated in 2009 making the concept of Darwinism even more popular than at the time it was originally proposed to the extent that it has acquired quasi religious status His theory revolves around a Tree of Life in which all living organisms are considered to have descended from a single ancestor and each node represents a common ancestor It comprises hierarchy and dichotomy which are typical characteristics of the post biblical 19th century vision Indeed according to post modern philosophy also called the French theory the majority of theories including scientific ones are based only on meta narratives expressing the influence of a culture at a given time Buddhism or Hinduism may have generated a very different story of evolution Our way of thinking about life and the way we describe evolution have changed radically in the 21st century due to the genomic revolution Comparative genome analyses have demonstrated that gene repertoires are

characterized by plasticity and there is strong evidence that nearly all genes have been exchanged at some point. Genomic data show that the genetic information of living organisms is inherited not only vertically but also laterally. Lateral gene transfers were at first observed only in bacteria which contain genes originating from eukaryotes, Archaea and viruses. Such transfers were subsequently identified in all living organisms. Giant viruses have chimeric genomes and the human genome is a mosaic of genes with eukaryotic, bacterial and viral origins. We cannot identify a single common ancestor for the gene repertoire of any organism. Furthermore, a very high proportion of genes have been newly created through gene fusion or degradation and others show no homology to sequences found in other species. It is now clear that every living organism has a variety of ancestors while exchanges between species are intense and the creation of new genes is frequent and permanent in all living organisms. Our current genomic knowledge contradicts the tree of life theory as established by Darwin. Recent analyses have produced bushes rather than resolved trees with the structure of some parts remaining elusive. It becomes more and more obvious that phylogenetic relationships are better described by forests and networks and that species evolution looks more like a rhizome. The chimerism and mosaic structure of all living organisms through both non vertical inheritance and de novo creation can only be assimilated and described by a post Darwinist concept. In this Research Topic we wish to highlight the influence of microbiology and genomics on our understanding of the complexity of gene repertoires and also demonstrate how current knowledge does not support Darwin's theory. Microbiology has offered a great advance in the way we perceive life. Evidence obtained from studies on bacterial and viral evolution, lateral inheritance, phylogenetic trees and biodiversity continues to challenge what constituted until recently an unimpeded dogma in biology.

The Welfare of Invertebrate Animals Claudio Carere, Jennifer Mather, 2019-07-02. This book is devoted to the welfare of invertebrates which make up 99% of animal species on earth. Addressing animal welfare, we do not often think of invertebrates; in fact, we seldom consider them to be deserving of welfare evaluation. And yet, we should. Welfare is a broad concern for any animal that we house, control, or utilize, and we utilize invertebrates a lot. The Authors start with an emphasis on the values of non-vertebrate animals and discuss the need for a book on the present topic. The following chapters focus on specific taxa, tackling questions that are most appropriate to each one: What is pain in crustaceans and how might we prevent it? How do we ensure that octopuses are not bored? What do bees need to thrive, pollinate our plants, and give us honey? Since invertebrates have distinct personalities and some social animals have group personalities, how do we consider this? And, as in the European Union's application of welfare consideration to cephalopods, how do the practical regulatory issues play

out We have previously relegated invertebrates to the category things and did not worry about their treatment New research suggest that some invertebrates such as cephalopods and crustaceans can have pain and suffering might also have consciousness and awareness Also good welfare is going to mean different things to spiders bees corals etc This book is taking animal welfare in a very different direction Academics and students of animal welfare science those who keep invertebrates for scientific research or in service to the goals of humans as well as philosophers will find this work thought provoking instructive and informative
