Changing Energy John H. Perkins, 2017-09-05 Changing Energy outlines how humanity came to its current energy economy through three previous energy transitions and now stands poised for a necessary fourth one Despite the immense benefits conferred by a global energy economy based primarily on coal oil gas and uranium societies must now rebuild their energy economies to rely as much as possible on renewable energy used efficiently This imperative to change comes from the risks of climate change plus the dangers of geopolitical tensions health and environmental effects and the long term prospects for ever depleting sources of today's energy sources Changing Energy argues that sustainability of the benefits from energy services will come from investments made in the technologies of the fourth transition Perkins envisions a viable post fossil fuel energy economy and outlines the barriers that must be resolved to reach it

Historical Dictionary of Environmentalism Peter Dauvergne, 2016-09-09 To capture the diversity within environmentalism this dictionary takes a global tack with a focus on ideas events institutions initiatives and green movements since the 1960s It strives to avoid a common error in many histories of environmentalism to exaggerate the input of the wealthy countries of Europe and North America and understate the influence of Africa Asia South and Central America and the Polar Regions It aims as well for a more comprehensive analysis than most histories of the modern environmental movement understanding environmentalism as emerging not only from grassroots and formal nongovernmental associations but also from corporate governmental and intergovernmental organizations and initiatives This assumes the ideas and energy infusing environmentalism with political purpose arise from hundreds of thousands of sources from corporate boardrooms to bureaucratic policies to international negotiations to activists Thus environmentalists are not only indigenous people blocking a logging road Greenpeace activists protesting a seal hunt or green candidates contesting an election an equal or larger number of environmentalists are working within the Japanese bureaucracy to implement environmental policies within the World Bank to assess the environmental impacts of loans within Wal Mart to green its purchasing practices or within intergovernmental forums to negotiate international environmental agreements This second edition of Historical Dictionary of Environmentalism contains a chronology an introduction and an extensive bibliography The dictionary section has over 300 cross referenced entries on important events issues organizations ideas and people shaping the direction of environmentalism worldwide This book is an excellent access point for students researchers and anyone wanting to know

more about environmentalism Clean Energy Transition and Load Capacity Factors: Environmental Sustainability Assessment through Advanced Statistical Methods, 2nd edition Zeeshan Fareed, Farrukh Shahzad, Solomon Prince Nathaniel, 2025-09-11 Both developed and developing countries are concerned about sustainable development and reducing environmental burdens. Environmental degradation is the deterioration of environmental quality caused by pollutants in the air as well as other activities and processes such as poor land use and natural disasters. Although carbon dioxide emissions and ecological footprint are commonly used by academics to quantify environmental degradation, assessing environmental sustainability requires a more complex and comprehensive ecological indicator. In this context, the load capacity factor allows for a comprehensive assessment of environmental sustainability by considering biocapacity and ecological footprint simultaneously. The ratio of per capita biocapacity to per capita ecological footprint is called the load capacity factor. This environmental quality indicator allows for environmental assessment from both a supply and demand perspective. In this context, discussion of the determinants of the load capacity factor is an important Research Topic. One way to combat environmental degradation is through the clean energy transition. The transition to clean energy can determine the environmental quality and thus load capacity. The transition to clean energy is a strategy to combat environmental damage. Previous empirical research used traditional environmental metrics: carbon emissions and ecological footprint, and outdated statistical methods to examine the influence of the energy transition on environmental degradation. Their results are contradictory and inconclusive. Therefore, to uncover a true link between the transition to renewable energy and environmental degradation, the current Research Topic requires unique statistical methods. In this Research Topic, we welcome new discussions that explore the relationship between load capacity factor, clean energy transition, and other macroeconomic indicators using recent time series and panel data analyses. For this Research Topic, we are looking for Original Research Review, new techniques, and methodologies. We look forward to receiving unique and creative contributions that focus on but are not limited to the following topics: Total renewable energy and load capacity factor; Sustainable development goals through load capacity factor; Energy transition and load capacity factor; Energy poverty and load capacity factor; Wind energy and load capacity factor; Hydro energy and load capacity factor; Geothermal energy and load capacity factor; Solar energy and load capacity factor; Novel empirical methods: time series, panel data to measure the energy load capacity factor relationship.
