Bartoloni, Maurizio Baussola, 2013-11-17T00:00:00+01:00 Innovation patterns in the food and food retail industries have been analyzed and compared with the more general patterns found in the manufacturing and wholesale retail sectors We find that the food industry despite its relevance within manufacturing is still characterized by a lower propensity to innovate This fact is particularly relevant if one considers that technological innovation may have significant effects on firms performance and thus it may affect their future growth perspectives This is crucial in the current Italian economic framework which is characterized by a general decrease in internal demand and by a sharp decrease in families real disposable income In this context food industry firms may be able to expand their production by creating new opportunities with new and better goods and or by increasing their export capacity We suggest that technological and non technological patterns of innovation should be considered simultaneously as the former typically implies the acquisition of internal to the firm capabilities brought about by other activities aimed at improving the internal organization or at gaining a better understanding of market evolution
