* Softening/Softening RR spring affects entry/exit by changing the dynamic cross weight of the car. Too big of an adjustment to the RR spring can have an opposite affect, especially on a slick track

A good starting point for the RR spring rate on a tacky track is 200lbs + 200lbs

important things to consider:

Remember there are two types of "Loose" and "Tight"

Types of Loose:

1. A car can be loose because the rear tires don't have enough grip

This can cause the rear end to slide around

2. A car can also be loose because the RR has too much grip

This can make the car over rotate because the RR is slowing the car around

Types of Tight

1. A car can be tight because the front tires don't have enough grip

This can cause the front end to cross gear up the track

2. A car can be tight because the LF has too much grip

This can cause the car to under rotate because the LF has to much grip

Drop Chart

25-100 is a good starting point for your Drop Chart

Increasing Drop can increase your fuel and wear. Sometimes but decrease dynamic load on Rear wheels

Increasing Drop can increase dynamic cross weight L/R side

Decreasing Drop can increase dynamic load on both the LF and RR wheels
