must be implemented in the near future *Tropical Forest Seed* Lars H. Schmidt, 2007-04-20 The role and perception of forests in tropical areas has changed drastically during the last half century Natural forests as resources for forest products are dwindling Sustainable management of natural forests faces many difficulties in practice although progress has been made However rural people in tropical countries often experience that the forests which were previously the buffer for agriculture and an important resource are becoming more and more inaccessible Remaining forests are to a large extent protected degraded or so far away from settlement that in practice they are beyond reach The majority of the world's forest products in the future will come from managed plantations and cultivated trees The term plantation usually referring to traditional block plantings of industrial species is acquiring a wider meaning which includes for example smaller woodlots shelterbelts and various types of agroforestry Forest seeds are in this context of utmost importance Not only are seeds the most commonly used propagation material they are also the carriers of the genetic material from one generation to the next Forest seed handling is thus an integrated part of selection management development and conservation of forest genetic resources in a larger context With this in mind and considering how self evident the matter of seed quality is in agriculture one can wonder how little attention has been and is given to forest germplasm in many afforestation and plantation programmes
