Can Neuroscience Change Our Minds? Hilary Rose, Steven Rose, 2016-09-06 Neuroscience with its astounding new technologies is uncovering the workings of the brain and with this perhaps the mind The neuro prefix spills out into every area of life from neuroaesthetics to neuroeconomics neurogastronomy and neuroeducation With its promise to cure physical and social ills government sees neuroscience as a tool to increase the mental capital of the children of the deprived and workless It sets aside intensifying poverty and inequality instead claiming that basing children's rearing and education on brain science will transform both the children and the nation's health and wealth Leading critic of such neuropretensions neuroscientist Steven Rose and sociologist of science Hilary Rose take a sceptical look at these claims and the science underlying them sifting out the sensible from the snake oil Examining the ways in which science is shaped by and shapes the political economy of neoliberalism they argue that neuroscience on its own is not able to bear the weight of these hopes

Will Robots Take Your Job?: A Plea for Consensus Nigel M. de S. Cameron, 2017-06-23 The trend that began with ATMs and do it yourself checkouts is moving at lightning speed Everything from driving to teaching to the care of the elderly and indeed code writing can now be done by smart machines Conventional wisdom says there will be new jobs to replace those we lose but is it so simple And are we ready Technology writer and think tank director Nigel Cameron argues it's naive to believe we face a smooth transition Whether or not there are new jobs we face massive disruption as the jobs millions of us are doing get outsourced to machines A twenty first century rust belt will rapidly corrode the labor market and affect literally hundreds of different kinds of jobs simultaneously Robots won't design our future we will Yet shockingly political leaders and policy makers don't seem to have this in their line of sight So how should we assess and prepare for the risks of this unknown future

Can Science Resolve the Nature / Nurture Debate? Margaret M. Lock, Gisli Palsson, 2016-06-20 Following centuries of debate about nature and nurture the discovery of DNA established the idea that nature genes determines who we are relegating nurture environment to icing on the cake Since the 1950s the new science of epigenetics has demonstrated how cellular environments and certain experiences and behaviors influence gene expression at the molecular level with significant implications for health and wellbeing To the amazement of scientists mapping the human genome indirectly supported these insights Anthropologists Margaret Lock and Gisli Palsson outline vituperative arguments from Classical times about the relationship between nature and nurture furthered today by epigenetic findings and the demonstration of a reactive genome The nature nurture debate they show can never be put to rest because these concepts are in constant flux in response to the new insights science continually offers

Should We Colonize Other Planets? Adam Morton, 2018-10-15 As humans continue to degrade and destroy our planet's resources leading to predictions of total ecological collapse some such as the entrepreneur Elon Musk now suggest that a

human colony elsewhere may be our species best hope for survival Adam Morton examines extra terrestrial colonization plans with a critical eye He makes a strong case for colonization just not by human beings Humans live relatively short lives and to survive require large amounts of food and water very specific climatic conditions and an oxygen rich atmosphere We can create colonists that have none of these shortcomings Reflecting compassionately on the nature of existence Morton argues that we should treat the end of the human race in the same way that we treat our own deaths as something sad but ultimately inevitable The earth will perish one day and in the end we should be concerned more with securing the future of intelligent beings than with the preservation of our species which represents but a nanosecond in the history of our solar system

Can Science End War? Everett Carl Dolman, 2015-10-14 Free roaming killer drones stalk the battlespace looking for organic targets Human combatants are programmed to feel no pain Highpower microwave beams detonate munitions jam communications and cook internal organs Is this vision of future war possible or even inevitable In this timely new book Everett Carl Dolman examines the relationship between science and war Historically science has played an important role in ending wars think of the part played by tanks in breaching trench warfare in the First World War or atom bombs in hastening the Japanese surrender in the Second World War but to date this has only increased the danger and destructiveness of future conflicts Could science ever create the conditions of a permanent peace either by making wars impossible to win or so horrific that no one would ever fight Ultimately Dolman argues that science cannot on its own end war without also ending what it means to be human

Shaping of Human Immune System and Metabolic Processes by Viruses and Microorganisms Marina I. Arleevskaya, Rustam Aminov, Wesley H. Brooks, Gayane Manukyan, Yves Renaudineau, 2019-08-15 Recent advances in the understanding of microbiota in health and diseases are

presented in this special issue of *Frontiers in Immunology* and *Frontiers in Microbiology* as well as their impact on the immune system that can lead to the development of pathologies. Potential perspectives and biomarkers are also addressed. We offer this Research Topic involving 64 articles and 501 authors to discuss recent advances regarding:

- 1 An overview of the human microbiota and its capacity to interact with the human immune system and metabolic processes
- 2 New developments in understanding the immune system's strategies to respond to infections and escape strategies used by pathogens to counteract such responses
- 3 The link between the microbiota and pathology in terms of autoimmunity, allergy, cancers and other diseases

Out-of-equilibrium Soft Matter Christina Kurzthaler, Luigi Gentile, Howard A Stone, 2023-03-24 The term active fluids refers to motions that are created by transforming energy from the surroundings into directed motion. There are many examples both natural and synthetic including individual swimming bacteria or motile cells, drops and bubbles that move owing to surface stresses so called Marangoni motions and chemical or optical driven colloids. Investigations into active fluids provide new insights into non equilibrium systems have the potential for novel applications and open new directions in physics, chemistry, biology and engineering. This book provides an expert introduction to active fluids systems covering simple to complex environments. It explains the interplay of chemical processes and hydrodynamics including the roles of mechanical and rheological properties across active fluids with reference to experiments, theory and simulations. These concepts are discussed for a variety of scenarios such as the trajectories of microswimmers, cell crawling and fluid stirring and apply to collective behaviours of dense suspensions and active gels. Emerging avenues of research are highlighted ranging from the role of active processes for biological functions to programmable active materials showcasing the exciting potential of this rapidly evolving research field.
