ManusCrypt Prashant A Upadhyaya,2024-11-29 Information security primarily serves these six distinct purposes authentication authorization prevention of data theft sensitive data safety privacy data protection integrity non repudiation The entire gamut of infosec rests upon cryptography The author begins as a protagonist to explain that modern cryptography is more suited for machines rather than humans This is explained through a brief history of ciphers and their evolution into cryptography and its various forms The premise is further reinforced by a critical assessment of algorithm based modern cryptography in the age of emerging technologies like artificial intelligence and blockchain With simple and lucid examples the author demonstrates that the hypothetical man versus machine scenario is not by chance but by design The book doesn t end here like most others that wind up with a sermon on ethics and eventual merging of humans with technology i e singularity A very much practicable solution has been presented with a real world use case scenario wherein infosec is

designed around the needs biases flaws and skills of humans This innovative approach as trivial as it may seem to some has the power to bring about a paradigm shift in the overall strategy of information technology that can change our world for the better

A Methodology for the Cryptanalysis of Classical Ciphers with Search Metaheuristics George Lasry, 2018 Cryptography the art and science of creating secret codes and cryptanalysis the art and science of breaking secret codes underwent a similar and parallel course during history Both fields evolved from manual encryption methods and manual codebreaking techniques to cipher machines and codebreaking machines in the first half of the 20th century and finally to computerbased encryption and cryptanalysis from the second half of the 20th century However despite the advent of modern computing technology some of the more challenging classical cipher systems and machines have not yet been successfully cryptanalyzed For others cryptanalytic methods exist but only for special and advantageous cases such as when large amounts of ciphertext are available Starting from the 1990s local search metaheuristics such as hill climbing genetic algorithms and simulated annealing have been employed and in some cases successfully for the cryptanalysis of several

classical ciphers In most cases however results were mixed and the application of such methods rather limited in their scope and performance In this work a robust framework and methodology for the cryptanalysis of classical ciphers using local search metaheuristics mainly hill climbing and simulated annealing is described In an extensive set of case studies conducted as part of this research this new methodology has been validated and demonstrated as highly effective for the cryptanalysis of several challenging cipher systems and machines which could not be effectively cryptanalyzed before and with drastic improvements compared to previously published methods This work also led to the decipherment of original encrypted messages from WWI and to the solution for the first time of several public cryptographic challenges **Teaching Children**
