## **Growth Factors And The Cardiovascular System Growth Factors And The Cardiovascular System:**

**Growth Factors and the Cardiovascular System** P. Cummins, 2012-12-06 Nature is totally amoral There are at least 34 million people in France alone who suffer from arterial hypertension and whose cardiovascular system is submitted day and night to both a haemodynamic and hormonal stress In all cases the vasculature hypertrophies as does the myocardium This growth process is obviously mainly detrimental at the outset since it lowers compliance of the arteries and makes them stiffer In contrast myocardial hypertrophy is initially beneficial since the growth process multiplies the number of contractile units and by so doing improves external work In addition according to Starling's law wall stress is lowered Growth factors play a major role in this amoral process as a trigger for hypertrophy at the vascular level and very likely at the level of the myocardium Another major point of interest is the role of growth factors as determinants of restenosis after angioplasty and also of atherogenesis Several chapters in this book are directly or indirectly concerned with this problem which is far from being purely academic since several groups are currently trying to control these processes by gene transfer Certainly one of the major clinical questions arising from such studies is why restenosis is not more frequent in clinical practice After de endothelialization the biologist would predict on the basis of recent studies on growth factors and in contrast with current clinical opinion that hypertrophy would occur in all cases with more or less complete restenosis *Development of*

Heart Failure José Marín-García,2010-06-23 *Heart Failure* HF is the final and common pathway of all cardiovascular diseases *Heart*

Failure Bench to Bedside helps address a significant need to develop new paradigms and to identify novel therapeutic targets for this pervasive disease. An authoritative contribution to the field, this book provides a detailed description of new findings and emerging methodologies as well as a critical clinical evaluation of the complex HF syndrome and future therapies. Heart Failure Bench to Bedside includes a primer on gene profiling and bioenergetics of the normal heart and a discussion of the molecular genetic, biochemical, and cellular techniques critical to understanding HF. Further chapters discuss cardiac remodeling, oxidative stress, and alterations in other organs and systems that are often associated with HF. This book thoughtfully evaluates current and forthcoming diagnostic techniques and therapies, pharmaceutical and pharmacogenomic based individualized medicine, gene and cell based therapies, and the search for new frontiers. Heart Failure Bench to Bedside presents a clear view of up to date approaches to clinical diagnosis and treatment as well as offering insightful critiques of original and creative scientific thoughts on post genomic HF research.

### **Cardiovascular Issues in Endocrinology**

R. Granata, J. Isgaard, 2014-06-13 Most endocrine diseases if not treated or controlled have cardiovascular manifestations. Both GH deficiency and GH excess impair cardiovascular functions e.g. in patients with acromegaly who have a shortened life expectancy and increased mortality mostly due to cardiovascular complications in uncontrolled disease. Moreover, Cushing's syndrome and diabetes are well known for metabolic and cardiovascular manifestations as well as hypo and hyperthyroidism. Both adipose tissue and the heart have been increasingly recognized as organs with partially endocrine functions which produce adipokines and brain natriuretic peptide respectively and influence a number of cardiovascular parameters. Primary aldosteronism as a cause for secondary hypertension is still a great challenge to detect and diagnose properly; however, new important discoveries have been made regarding the genetics of this probably underestimated cause of hypertension. Written by distinguished researchers in their respective fields, this book will give both researchers and clinicians an excellent update on all these topics as well as provide insight into the use of hormones as treatment tools in more controversial areas.

Gene Transfer in the Cardiovascular System Keith L. March, 2012-12-06 The goal of gene transfer is protein expression, a process brought about by the insertion of a gene coding for a foreign protein into target cells, resulting in the synthesis of the foreign protein. For gene therapy, a transferred therapeutic gene must be expressed at a level beneficial for the patient. This chapter provides an introductory overview of the rapidly evolving field of non-viral approaches for gene delivery to mammalian cells. Although currently there are fewer ongoing clinical trials using non-viral approaches than those using viral based systems, the number of non-viral trials is increasing. The long range goal of some research groups is the development of a genetically engineered artificial virus targeted to specific cells in the human body. An annual conference organized by Cambridge Healthtech Institute entitled Artificial Self Assembling Systems for Gene Transfer brings together researchers interested in this field. 1. Assembly of an artificial virus is very complex; other research groups aim to develop simpler delivery systems consisting of a plasmid combined with delivery agents. Viral based systems are very successful for gene delivery but

despite their successes viral based systems have some general limitations and system specific limitations When employing a viral based system the following limitations should be considered size limitation of the inserted gene due to packaging constraints e g adenovirus retrovirus potential tumorigenesis e g retrovirus potential for insertional mutagenesis greater than plasmid based systems potential immunogenicity e g
