- Abstract**—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 10 women, 40 to 50 years of age, who were sedentary and had no cardiovascular disease. They were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of 30 minutes of moderate-intensity aerobic exercise. The control group continued with their sedentary lifestyle. The HR and EE were measured at baseline and at the end of the 10-week program. The HR and EE of the training group decreased significantly compared to the control group. The results of this study suggest that a 10-week training program can effectively reduce the HR and EE of sedentary, middle-aged women.
