Materials in Space - Science, Technology and Exploration: Volume 551 Aloysius F. Hepp, 1999-11-26 The MRS Symposium Proceeding series is an internationally recognised reference suitable for researchers and practitioners

Materials in Space - Science, Technology and Exploration: Josep M. Prah, 2014-06-05 This symposium was held to commemorate the 40th anniversary of the National Aeronautics and Space Administration NASA it was also the 25th anniversary of the Materials Research Society The coincidence of anniversaries provided an excellent opportunity to consider how materials science has contributed to the space program and how it will continue to contribute to the future of space exploration Living and working in space presents extreme challenges that have only begun to be met by the materials research community This book brings together researchers from government industry and university laboratories to discuss successes and ongoing research in the application of materials science to the space program Topics include space exploration space photovoltaics materials for energy conversion and storage fundamental studies for advanced materials and devices microgravity materials processing and materials for space and other hostile environments Commercial spin offs from past space related materials research are also featured

Solidification of Containerless Undercooled Melts Dieter M. Herlach, Douglas M. Matson, 2012-05-21 All metallic materials are prepared from the liquid state as their parent phase Solidification is therefore one of the most important phase transformation in daily human life Solidification is the transition from liquid to solid state of matter The conditions under which material is transformed determines the physical and chemical properties of the as solidified body The processes involved like nucleation and crystal growth are governed by heat and mass transport Convection and undercooling provide additional processing parameters to tune the solidification process and to control solid material performance from the very beginning of the production chain To develop a predictive capability for efficient materials production the processes involved in solidification have to be understood in detail This book provides a comprehensive overview of the solidification of metallic melts processed and undercooled in a containerless manner by drop tube electromagnetic and electrostatic levitation and experiments in reduced gravity The experiments are accompanied by model calculations on the influence of thermodynamic and hydrodynamic conditions that control selection of nucleation mechanisms and modify crystal growth development throughout the solidification process

Comprehensive Nuclear Materials, 2020-07-22 Materials in a nuclear environment are exposed to

extreme conditions of radiation temperature and or corrosion and in many cases the combination of these makes the material

behavior very different from conventional materials This is evident for the four major technological challenges the nuclear technology domain is facing currently i long term operation of existing Generation II nuclear power plants ii the design of the next generation reactors Generation IV iii the construction of the ITER fusion reactor in Cadarache France iv and the intermediate and final disposal of nuclear waste In order to address these challenges engineers and designers need to know the properties of a wide variety of materials under these conditions and to understand the underlying processes affecting changes in their behavior in order to assess their performance and to determine the limits of operation Comprehensive Nuclear Materials Second Edition Seven Volume Set provides broad ranging validated summaries of all the major topics in the field of nuclear material research for fission as well as fusion reactor systems Attention is given to the fundamental scientific aspects of nuclear materials fuel and structural materials for fission reactors waste materials and materials for fusion reactors The articles are written at a level that allows undergraduate students to understand the material while providing active researchers with a ready reference resource of information Most of the chapters from the first Edition have been revised and updated and a significant number of new topics are covered in completely new material During the ten years between the two editions the challenge for applications of nuclear materials has been significantly impacted by world events public awareness and technological innovation Materials play a key role as enablers of new technologies and we trust that this new edition of Comprehensive Nuclear Materials has captured the key recent developments Critically reviews the major classes and functions of materials supporting the selection assessment validation and engineering of materials in extreme nuclear environments Comprehensive resource for up to date and authoritative information which is not always available elsewhere even in journals Provides an in depth treatment of materials modeling and simulation with a specific focus on nuclear issues Serves as an excellent entry point for students and researchers new to the field **The Nation**

Science Research H. Otte, 1965-06-01 The challenges of space exploration are a great stimulus to our technologies today. Development of successful aerospace programs has required the best efforts of the scientist and engineer in almost every discipline. Not so long ago it truly could be said that designers are trying to develop tomorrow's vehicles with yesterday's materials. Unfortunately we find that the situation remains nearly the same today. The purpose of this conference was to identify materials processes and methods that show the greatest potential in future space technology and to define the gap between mission requirements and materials application. Of the many properties of materials the one in which the largest gap between fundamental understanding and practical application appears to exist is the mechanical property particularly of crystalline materials. The emphasis on crystalline materials is a natural one. It is these materials which are used primarily when demands are placed on mechanical strength especially at elevated temperatures. The advent of space exploration requires the utilization of materials in environments and under conditions that are a challenge to the resourcefulness and ingenuity of the scientist and engineer. The scientist can as a result of the past thirty years work relate mechanical properties to the formation, motion and interaction of individual crystalline defects such as vacancies, interstitials and dislocations. Furthermore he can by controlled preparation of his materials confine his studies to those cases in which the concentration of crystal defects is conveniently low.
