Materials for Fuel Cells M Gasik,2008-10-27 A fuel cell is an electrochemical device that converts the chemical energy of a reaction between fuel and oxidant directly into electricity Given their efficiency and low emissions fuel cells provide an important alternative to power produced from fossil fuels A major challenge in their use is the need for better materials to make fuel cells cost effective and more durable This important book reviews developments in materials to fulfil the potential of fuel cells as a major power source After introductory chapters on the key issues in fuel cell materials research the book reviews the major types of fuel cell These include alkaline fuel cells polymer electrolyte fuel cells direct methanol fuel cells phosphoric acid fuel cells molten carbonate fuel cells solid oxide fuel cells and regenerative fuel cells The book concludes with reviews of novel fuel cell materials ways of analysing performance and issues affecting recyclability and life cycle assessment With its distinguished editor and international team of contributors Materials for fuel cells is a valuable reference for all those researching manufacturing and using fuel cells in such areas as automotive engineering Examines the key issues in fuel cell materials research Reviews the major types of fuel cells such as direct methanol and regenerative fuel cells Further chapters explore ways of analysing performance and issues affecting recyclability and life cycle assessment

Sustainable Materials for Fuel Cell Technologies Inamuddin,Tariq Altalhi,Jorddy Neves Cruz,2025-09-03 Sustainable Materials for Fuel Cell Technologies offers a comprehensive look at the advancements challenges and future of sustainable materials in fuel cell technology making it essential for anyone interested in the drive towards a cleaner energy future The development of fuel cell technologies is driven by the growing demand for clean and sustainable energy solutions The applications of fuel cells span a wide range of sectors including transportation stationary power generation and portable electronics The development of sustainable materials for fuel cells is crucial for overcoming the challenges that hinder the widespread adoption of this technology These challenges include cost durability efficiency and the use of precious metals in catalysts Researchers and industries are actively working to address these challenges by developing new materials improving manufacturing processes and exploring innovative approaches such as using abundant and low cost materials as catalysts Overall the field of sustainable materials for fuel cells is an exciting and rapidly evolving area of research and development This book aims to provide a comprehensive understanding of the disciplinary and industry aspects of fuel cell technologies highlighting the advancements challenges and future prospects of sustainable materials that are vital for driving the transition towards a more sustainable and clean energy future *Treatment of Biogas for Feeding High Temperature Fuel Cells* Maria Turco,Angelo Ausiello,Luca Micoli,2016-02-13 This book reports on the most recent applications of processes with a particular focus on the source and the properties of biogas and on the characteristics of the fuel cells FCs It describes adsorbing materials of potential interest are reviewed and the preparation methods and treatments employed to improve the

adsorption properties as well as the stability and regenerability The characterization of the chemical and physical properties involved in these processes is examined in particular detail The book also covers aspects that concern the development of the adsorption apparatus with particular attention on the target of low residual concentration and high selectivity High temperature FCs such as molten carbonates MCFCs or solid oxides SOFCs are efficient with a low environmental impact and they can use a wide variety of fuels such as biogas The presence of some poisonous compounds such as sulphides halides and siloxanes can react with electrode catalysts and electrolyte leading to the degradation and short lifetime of the cell The treatment of raw biogas to obtain a FC compatible fuel is mainly based on adsorption processes on suitable materials
