Mathematical Methods and Modelling in Hydrocarbon Exploration and Production Armin

Iske, Trygve Randen, 2006-01-27 Hydrocarbon exploration and production incorporate great technology challenges for the oil and gas industry. In order to meet the world's future demand for oil and gas, further technological advance is needed which in turn requires research across multiple disciplines including mathematics, geophysics, geology, petroleum engineering, signal processing, and computer science. This book addresses important aspects and fundamental concepts in hydrocarbon exploration and production. Moreover, new developments and recent advances in the relevant research areas are discussed, whereby special emphasis is placed on mathematical methods and modelling. The book reflects the multi-disciplinary character of the hydrocarbon production workflow, ranging from seismic data imaging, seismic analysis and interpretation, and geological model building to numerical reservoir simulation. Various challenges concerning the production workflow are discussed in detail. The thirteen chapters of this joint work, authored by international experts from academic and industrial institutions, include survey papers of expository character as well as original research articles. Large parts of the material presented in this book were developed between November 2000 and April 2004 through the European research and training network NetAGES (Network for Automated Geometry Extraction from Seismic). The new methods described here are currently being implemented as software tools at Schlumberger Stavanger Research, one of the world's largest service providers to the oil industry.

Mathematical Methods and Models in Biomedicine Urszula

Ledzewicz, Heinz Schättler, Avner Friedman, Eugene Kashdan, 2012-10-21 Mathematical biomedicine is a rapidly developing interdisciplinary field of research that connects the natural and exact sciences in an attempt to respond to the modeling and simulation challenges raised by biology and medicine. There exist a large number of mathematical methods and procedures that can be brought in to meet these challenges, and this book presents a palette of such tools, ranging from discrete cellular automata to cell population-based models described by ordinary differential equations to nonlinear partial differential equations representing complex time and space-dependent continuous processes. Both stochastic and deterministic methods are employed to analyze biological phenomena in various temporal and spatial settings. This book illustrates the breadth and depth of research opportunities that exist in the general field of mathematical biomedicine by highlighting some of the fascinating interactions that continue to develop between the mathematical and biomedical sciences. It consists of five parts.

that can be read independently but are arranged to give the reader a broader picture of specific research topics and the mathematical tools that are being applied in its modeling and analysis The main areas covered include immune system modeling blood vessel dynamics cancer modeling and treatment and epidemiology The chapters address topics that are at the forefront of current biomedical research such as cancer stem cells immunodominance and viral epitopes aggressive forms of brain cancer or gene therapy The presentations highlight how mathematical modeling can enhance biomedical understanding and will be of interest to both the mathematical and the biomedical communities including researchers already working in the field as well as those who might consider entering it Much of the material is presented in a way that gives graduate students and young researchers a starting point for their own work **Advanced Mathematical**
