Foundations of Mathematical Economics Michael Carter, 2001-10-26 This book provides a comprehensive introduction to the mathematical foundations of economics from basic set theory to fixed point theorems and constrained optimization Rather than simply offer a collection of problem solving techniques the book emphasizes the unifying mathematical principles that underlie economics Features include an extended presentation of separation theorems and their applications an account of constraint qualification in constrained optimization and an introduction to monotone comparative statics These topics are developed by way of more than 800 exercises The book is designed to be used as a graduate text a resource for self study and a reference for the professional economist

Introduction to the Theory of Optimization in Euclidean Space Samia Challal, 2019-11-11 Introduction to the Theory of Optimization in Euclidean Space is intended to provide students with a robust introduction to optimization in Euclidean space demonstrating the theoretical aspects of the subject whilst also providing clear proofs and applications Students are taken progressively through the development of the proofs where they have the occasion to practice tools of differentiation Chain rule Taylor formula for functions of several variables in abstract situations Throughout this book students will learn the necessity of referring to important results established in advanced Algebra and Analysis courses Features Rigorous and practical offering proofs and applications of theorems Suitable as a textbook for advanced undergraduate students on mathematics or economics courses or as reference for graduate level

readers Introduces complex principles in a clear illustrative fashion *Optimization and Stability Theory for Economic Analysis* Brian Beavis,Ian M. Dobbs,1990 This book presents a coherent and systematic exposition of the mathematical theory of the problems of optimization and stability Both of these are topics central to economic analysis since the latter is so much concerned with the optimizing behaviour of economic agents and the stability of the interaction processes to which this gives rise The topics covered include convexity mathematical programming fixed point theorems comparative static analysis and duality the stability of dynamic systems the calculus of variations and optimal control theory The authors present a more detailed and wide ranging discussion of these topics than is to be found in the few books which attempt a similar coverage Although the text deals with fairly advanced material the mathematical prerequisites are minimised by the inclusion of an integrated mathematical review designed to make the text self contained and accessible to the reader with only an elementary knowledge of calculus and linear algebra A novel feature of the book is that it provides the reader with an understanding and feel for the kinds of mathematical techniques most useful for dealing with particular economic problems This is achieved through an extensive use of a broad range of economic examples rather than the numerical algebraic examples so often found This is suitable for use in advanced undergraduate and postgraduate courses in economic analysis and should in addition prove a useful reference work for practising economists **Handbook of Game Theory with Economic Applications** R.J. Aumann,S. Hart,1992 This is the second of three volumes surveying the state of the art in Game Theory and its applications to many and varied fields in particular to economics The chapters in the present volume are contributed by outstanding authorities and provide comprehensive coverage and precise statements of the main results in each area The applications include empirical evidence The following topics are covered communication and correlated equilibria coalitional games and coalition structures utility and subjective probability common knowledge bargaining zero sum games differential games and applications of game theory to signalling moral hazard search evolutionary biology international relations voting procedures social choice public economics politics and cost allocation This handbook will be of interest to scholars in economics political science psychology mathematics and biology For more information on the Handbooks in Economics series please see our home page on <http://www.elsevier.nl/locate/hes> Advanced Mathematical Methods In Environmental And Resource Economics Anastasios Xepapadeas,2022-09-20 The most interesting issues in environmental and resource economics have an explicit temporal dimension since variables of interest such as pollutants greenhouse gases biomass of biological resources or the stocks of fossil fuels accumulate in the ambient environment or are depleted through human actions and natural processes The purpose of these lectures is to present the mathematical tools for analyzing environmental and resource management issues in a dynamic set up The lectures include a brief description of differential equations and then move on to describe methods of optimal control dynamic programming and differential games The final chapters cover two novel topics 1 environmental issues characterized by deep uncertainty and aversion to

ambiguity using robust control methods and formulations of precautionary policies and 2 the study of pollution resource management in space and time when the environmental variables evolve in time and diffuse in space The lectures are a valuable tool for advanced graduate students in environmental and resource economics who are studying dynamic problems

This volume will be of interest to both graduate students and research mathematicians.

Lectures In The Microeconomics Of Choice: Foundations, Consumers, And Producers William David Anthony Bryant, 2023-02-17 People pursue their own interests whatever those interests might be. Some people have interests that are narrow and selfish while others have interests that are broad and altruistic. The idea that people are self-interested underpins all of economic analysis and raises two fundamental questions: 1. How do people choose the actions they think will further their own interests? 2. Can the potentially conflicting interests of different people be made to mesh in some sort of socio-economic equilibrium? This book is devoted to a detailed study of the first question. Its Companion Volume, *Economy Wide Microeconomics: Equilibrium, Optimality, Applications and Tests*, makes a detailed study of the second question. Following some foundational remarks, this book studies the Arrow-Debreu theory of consumer choice. That theory supposes people choose so as to maximize a complete, continuous, transitive and reflexive binary preference relation over a non-empty and compact choice set. The book then studies numerous refinements, generalizations and extensions of each of these restrictions up to and including recent work on Behavioral theories of choice and choice behaviour when preferences are intransitive, incomplete, discontinuous. Also considered is choice behaviour in environments that are not necessarily compact. A study is also made of intertemporal choice and choice under uncertainty. The study of Arrow-Debreu choice theory and its extensions are presented from the Primal, Dual and Revealed Preference points of view. Consumers are not the only agents in the economy as Producers are present as well. Beginning with a study of the Arrow-Debreu idea that producers choose from a convex production set so as to maximize profit, the book considers extensions and generalizations of this framework particularly to non-convex environments. The study is presented from the Primal and Dual points of view. The final chapter in the book provides a link to its Companion Volume. The Chapter indicates how the theories

of consumer and producer choice studied here help inform answers of the second question posed above Resources are available to instructors who adopt this book More details at www.worldscientific.com/worldscibooks/10.1142/12789_sm

Game Theoretic Analysis Leon A Petrosyan, David W K Yeung, 2019-10-14 This is a collection of recent novel contributions in game theory from a group of prominent authors in the field It covers Non cooperative Games Equilibrium Analysis Cooperative Games and Axiomatic Values in static and dynamic contexts Part 1 Non cooperative Games and Equilibrium Analysis In game theory a non cooperative game is a game with competition between individual players and in which only self enforcing e g through credible threats alliances or competition between groups of players called coalitions are possible due to the absence of external means to enforce cooperative behavior e g contract law as opposed to cooperative games In fact non cooperative games are the foundation for the development of cooperative games by acting as the status quo Non cooperative games are generally analysed through the framework of equilibrium which tries to predict players individual strategies and payoffs Indeed equilibrium analysis is the centre of non cooperative games This volume on non cooperative games and equilibrium analysis contains a variety of non cooperative games and non cooperative game equilibria from prominent authors in the field Part 2 Cooperative Games and Axiomatic Values It is well known that non cooperative behaviours in general would not lead to a Pareto optimal outcome Highly undesirable outcomes like the prisoner s dilemma and even devastating results like the tragedy of the commons could appear when the involved parties only care about their individual interests in a non cooperative situation Cooperative games offer the possibility of obtaining socially optimal and group efficient solutions to decision problems involving strategic actions In addition axiomatic values serve as guidance for establishing cooperative solutions This volume on cooperative games and axiomatic values presents a collection of cooperative games and axiomatic values from prominent authors in the field
