Mathematical Therapeutic Approaches Transmission Mathematics:

Mathematical Models for Therapeutic Approaches to Control HIV Disease Transmission Priti Kumar Roy, 2015-12-08 The book discusses different therapeutic approaches based on different mathematical models to control the HIV AIDS disease transmission. It uses clinical data collected from different cited sources to formulate the deterministic as well as stochastic mathematical models of HIV AIDS. It provides complementary approaches from deterministic and stochastic points of view to optimal control strategy with perfect drug adherence and also tries to seek viewpoints of the same issue from different angles with various mathematical models to computer simulations. The book presents essential methods and techniques for students who are interested in designing epidemiological models on HIV AIDS. It also guides research scientists working in the periphery of mathematical modeling and helps them to explore a hypothetical method by examining its consequences in the form of a mathematical modelling and making some scientific predictions. The model equations, mathematical analysis, and several numerical simulations that are presented in the book would serve to reveal the consequences of the logical structure of the disease transmission quantitatively as well as qualitatively. One of the chapters introduces the optimal control approach towards the mathematical models describing the optimal drug dosage process that is discussed with the basic deterministic models dealing with stability analysis. Another one chapter deals with the mathematical analysis for the perfect drug adherence for different drug dynamics during the treatment management. The last chapter of the book consists the stochastic approach to the disease dynamics on HIV AIDS. This method helps to move the disease HIV AIDS to extinction as the time to increase. This book will appeal to undergraduate and postgraduate students as well as researchers who are studying and working in the field of bio mathematical modelling on infectious diseases, applied mathematics, health informatics, applied statistics, and qualitative public health etc. Social workers who are working in the field of HIV will also find the book useful for complements.

Mathematical Models for Therapeutic Approaches to Control Psoriasis Priti Kumar Roy, Abhirup Datta, 2019-07-18 This book discusses several mathematical models highlighting the disease dynamics of psoriasis and its control. It explains the control of keratinocyte concentration through a negative feedback mechanism and the effect of including a realistic time delay in that system. The effect of cytokine release is described in a mathematical model of psoriasis and further elucidated in two different mathematical pathways: the ordinary differential equation model system and the fractional order differential equation model system. The book also identifies the role of CD8 T cells in psoriasis by investigating the interaction between dendritic cells and CD8 T cells. Presenting an approach to control the fractional order system to prevent excess production of keratinocyte cell population, the book is intended for researchers and scientists in the field of applied mathematics, health informatics, applied statistics, and qualitative public health as well as bio mathematicians interested in the mathematical modeling of autoimmune diseases like psoriasis.

Mathematics of Planet Earth Hans G. Kaper, Fred S. Roberts, 2019-11-01. Since its inception in 2013, Mathematics of Planet Earth (MPE) focuses on mathematical issues arising in the study of our planet. Interested in the impact of human activities on the Earth's system, this multidisciplinary field considers the planet not only as a physical system but also as a system supporting life, a system organized by humans, and a system at risk. The articles collected in this volume demonstrate the breadth of techniques and tools from mathematics, statistics, and operations research used in MPE. Topics include climate modeling, the spread of infectious diseases, stability of ecosystems, ecosystem services, biodiversity, infrastructure restoration after an extreme event, urban environments, food security, and food safety. Demonstrating the mathematical sciences in action, this book presents real world challenges for the mathematical sciences, highlighting applications to issues of current concern to society. Arranged into three topical sections: Geo and Physical Sciences, Life Sciences, Ecology and Evolution, Socio-economics, and Infrastructure, thirteen chapters address questions such as: how to measure biodiversity, what mathematics can say about the sixth mass extinction, how to optimize the long-term human use of natural capital, and the impact of data on infrastructure management. The book also treats the subject of infectious diseases with new examples and presents an introduction to the mathematics of food systems and food security. Each chapter functions as an introduction that can be studied independently, offering source material for graduate student seminars and self-study. The range of featured research topics provides mathematical scientists with starting points for the study of our planet and the impact of human activities. At the same time, it offers application scientists a plethora of modern mathematical tools and techniques to address the various topics in practice. Including hundreds of references to the vast literature associated with each topic, this book serves as an inspiration for further research.

Justified Modeling Frameworks and Novel Interpretations of Ecological and Epidemiological Systems Bapan Ghosh, Salih Djilali, Asep K. Supriatna, 2024-01-12 The Lotka Volterra and the Kermack McKendrick models are well celebrated and widely recognized in the field of ecology and epidemiology Several modified ordinary differential equation models have been proposed over the last many decades to rationalize complex biological phenomena In the current century researchers have paid much attention to developing new modeling frameworks with delay differential equations difference equations fractional order systems stochastic differential equations etc No doubt these models have emerged many new bifurcations theory and methods which have equally contributed to the advances of Mathematics and interdisciplinary

research It is argued that these new modeling frameworks perform more effectively in analyzing and interpreting results compared to the conventional modeling frameworks with ordinary differential equations However implications of emerged bifurcations from new modeling approaches are often less interpreted from a biological viewpoint Even there is also a lack of understanding of how a fractional order model for instance displays a more realistic scenario to analyze a biological process Therefore a more serious justification is essential while modeling any biological event
