The ninth edition, with large additions. With a portrait* John Locke, 1731 String Figures as Mathematics? Eric Vandendriessche, 2015-01-02 This book addresses the mathematical rationality contained in the making of string figures It does so by using interdisciplinary methods borrowed from anthropology mathematics history and philosophy of mathematics The practice of string figure making has long been carried out in many societies and particularly in those of oral tradition It consists in applying a succession of operations to a string knotted into a loop mostly using the fingers and sometimes the feet the wrists or the mouth This succession of operations is intended to generate a final figure The book explores different modes of conceptualization of the practice of string figure making and analyses various source material through these conceptual tools it looks at research by mathematicians as well as ethnographical publications and personal fieldwork findings in the Chaco Paraguay and in the Trobriand Islands Papua New Guinea which all give evidence of the rationality that underlies this activity It concludes that the creation of string figures may be seen as the result of intellectual processes involving the elaboration of algorithms and concepts such as operation sub procedure iteration and transformation **The African Mother Tongue and Mathematical Ideas** Abdul Karim Bangura, 2020-06-02 This book by renowned scholar Dr Abdul Karim Bangura combines linguistics and mathematics to show how and why African centred

mathematical ideas can be a driving force in Africa's development efforts Bangura explores the concept that Africa has been the centre of the History of Mathematics for thousands of years as the civilizations that emerged across the continent developed contributions which would enrich both ancient and modern understanding of nature through mathematics However scholars and other professionals working in the field of mathematics education in Africa have identified a plethora of issues in carrying out their tasks This is highlighted by one of the most compelling arguments in the book which is that a major reason for these problems is the fact that the African mother tongues has been greatly neglected in the teaching of mathematics in the continent Bangura asserts that a change has to be made in order for Africa to benefit from the exceptional opportunities mathematics offer showing that even if there is a great body of work connecting linguistics and mathematics few analyses have been performed on the link between African languages and mathematics and the ones that have been made are not theoretically grounded on linguistics Thus the book begins by identifying the objects of study of linguistics and mathematics and delineates which ones they have in common Next since the object of study of linguistics is language the nine design features of language are employed to examine each of the objects as it pertains to African languages After that mathematical ideas of sustainability and those of tipping points are suggested as means to help Africa's development efforts
