Materials For Conservation Materials For Conservation:

Materials for Conservation C V Horie, 2013-05-13 *Materials in Conservation* is the definitive introduction to the properties of materials used in conservation. The continual struggle of conservators to ameliorate the deterioration of objects has led to increasing use of synthetic polymers. These materials are part of the sophisticated technology that has been developed to augment and often replace traditional materials and methods. Conservators therefore have a wider range of techniques available. However they must be able to appreciate the potentials and pitfalls of any proposed technique. The first section explains physical and chemical properties which are important in the conservation process i.e. application, ageing, reversal. The topics covered include molecular weight, glass transition temperature, solubility and solvents, polymerisation and degradation reactions. The second section provides a detailed consideration of the individual materials current and obsolete used in conservation, drawing out the factors relevant to their effects on objects. The conservation uses of each material are summarised and referenced to allow further study. In five appendices the properties of the polymers, solvents and their interactions are tabulated with a list of suppliers and conversion table of physical units. IUPAC and SI nomenclature is used throughout the book. In this second edition this classic text is revised and updated to include modern materials such as cyclododecane and current ideas on adhesion, consolidation and reversibility, making *Materials in Conservation* the definitive source of vital information in the field. This handy reference book should be on the bench of every conservator and available wherever objects from steam engines to dried plants are preserved.

This book will introduce the reader to the wide variety of analytical techniques that are employed by those working on the conservation of materials. An introduction to each technique is provided with explanations of how data may be obtained and interpreted. Examples and case studies will be included to illustrate how each technique is used in practice. The fields studied include inorganic materials, polymers, biomaterials and metals. Clear examples of data analysis feature designed to assist the reader in their choice of analytical method. [Learning to look ahead: the need for a national materials policy and planning process](#)

[Science and Heritage](#) Great Britain: Parliament: House of Lords: Science and Technology Committee,2006-11-16 The conservation of cultural artefacts such as buildings works of art and books presents a fascinating rich and diverse range of scientific challenges and the UK has a high reputation in the field based in large part on past achievements However the Committee s report finds that our national standing is now under threat as the sector is fragmented and under valued and the DCMS has completely failed to grasp the threat to heritage science and thus to conservation The Department s emphasis on widening public access to our cultural heritage is a laudable objective but this policy needs to be balanced by effective conservation based on sound science if we are to leave a sustainable cultural heritage for the benefit of future generations The Committee also calls on the heritage sector to come together in developing a broad based national strategy for heritage science to be championed at departmental level by the newly appointed DCMS Chief Scientific Adviser and co ordinated administratively by English Heritage drawing on input from all bodies active in the sector including those in Scotland Wales and Northern Ireland [Library of Congress Subject Headings](#) Library of Congress.
