Spectral Elements for Transport-Dominated Equations Daniele Funaro, 2012-12-06 In the last few years there has been a growing interest in the development of numerical techniques appropriate for the approximation of differential model problems presenting multiscale solutions This is the case for instance with functions displaying a smooth behavior except in certain regions where sudden and sharp variations are localized Typical examples are internal or boundary layers When the number of degrees of freedom in the discretization process is not sufficient to ensure a fine resolution of the layers some stabilization procedures are needed to avoid unpleasant oscillatory effects without adding too much artificial viscosity to the scheme In the field of finite elements the streamline diffusion method the Galerkin least squares method the bubble function approach and other recent similar techniques provide excellent treatments of transport equations of elliptic type with small diffusive terms referred to in fluid dynamics as advection diffusion or convection diffusion equations Goals This book is an attempt to guide the reader in the construction of a computational code based on the spectral collocation method using algebraic polynomials The main topic is the approximation of elliptic type boundary value partial differential equations in 2 D with special attention to transport diffusion equations where the second order diffusive terms are strongly dominated by the first order advective terms Applications will be considered especially in the case where nonlinear systems of partial differential equations can be reduced to a sequence of transport diffusion equations

Mathematical Models for Poroelastic Flows Anvarbek Meirmanov, 2013-11-29 The book is devoted to rigorous derivation of macroscopic mathematical models as a homogenization of exact mathematical models at the microscopic level The idea is quite natural one first must describe the joint motion of the elastic skeleton and the fluid in pores at the microscopic level by means of classical continuum mechanics and then use homogenization to find appropriate approximation models homogenized equations The Navier Stokes equations still hold at this scale of the pore size in the order of 5 15 microns Thus as we have mentioned above the macroscopic mathematical models obtained are still within the limits of physical applicability These mathematical models describe different physical processes of liquid filtration and acoustics in poroelastic media such as isothermal or non isothermal filtration hydraulic shock isothermal or non isothermal acoustics diffusion convection filtration and acoustics in composite media or in porous fractured reservoirs Our research is based upon the Nguetseng two scale convergent method
