Mathematics As A Laboratory Tool Dynamics Delays And Noise:

Mathematics as a Laboratory Tool John Milton, Toru Ohira, 2014-09-18 This introductory textbook is based on the premise that the foundation of good science is good data The educational challenge addressed by this introductory textbook is how to present a sampling of the wide range of mathematical tools available for laboratory research to well motivated students with a mathematical background limited to an introductory course in calculus Mathematics as a Laboratory Tool

John Milton, Toru Ohira, 2021-08-11 The second edition of Mathematics as a Laboratory Tool reflects the growing impact that computational science is having on the career choices made by undergraduate science and engineering students The focus is on dynamics and the effects of time delays and stochastic perturbations noise on the regulation provided by feedback control systems The concepts are illustrated with applications to gene regulatory networks motor control neuroscience and population biology The presentation in the first edition has been extended to include discussions of neuronal excitability and bursting multistability microchaos Bayesian inference second order delay differential equations and the semi discretization method for the numerical integration of delay differential equations Every effort has been made to ensure that the material is accessible to those with a background in calculus The text provides advanced mathematical concepts such as the Laplace and Fourier integral transforms in the form of Tools Bayesian inference is introduced using a number of detective type scenarios including the Monty Hall problem

Delay and Uncertainty in Human Balancing Tasks Tamás Insperger, John Milton, 2021-10-18 This book demonstrates how delay differential equations DDEs can be used to compliment the laboratory investigation of human balancing tasks This approach is made accessible to non specialists by comparing mathematical predictions and experimental observations For example the observation that a longer pole is easier to balance on a fingertip than a shorter one demonstrates the essential role played by a time delay in the balance control mechanism Another balancing task considered is postural sway during quiet standing With the inverted pendulum as the driver and the feedback control depending on state variables or on an internal model the feedback can be identified by determining a critical pendulum length and or a critical delay This approach is used to identify the nature of the feedback for the pole balancing and postural sway examples Motivated by the question of how the nervous system deals with these feedback control challenges there is a discussion of microchaotic fluctuations in balance control and how robust control can be achieved in the face of uncertainties in the estimation of control parameters The final chapter suggests some topics for future research Each chapter includes an abstract and a point by point summary of the main concepts that have been established A particularly useful numerical integration method for the DDEs that arise in balance control is semi discretization This method is described and a MATLAB template is provided This book will be a useful source for anyone studying balance in humans other bipedal organisms and humanoid robots Much of the material has been used by the authors to teach senior undergraduates in computational neuroscience and students in bio systems biomedical mechanical and neural engineering Dynamics of

Physiological Control Yoichiro Mori, Benoît Perthame, Angela Stevens, 2025-04-03 This book provides an overview of recent mathematical models for dynamics in cellular systems and offers a unique vision of the field by prominent experts It covers among others the regulatory basis of oscillations in biological systems ergodic and chaotic properties in biological models with the example of maturity distribution of precursors of blood cells time delayed feedbacks mathematical models of cell division and heterogeneous stem cell regeneration quantitative mathematical modeling of glucose regulation data driven models of chemotherapy induced neutropenia and effects of irradiation and antioxidants in Alzheimer s disease This book is directed towards mathematicians interested in learning about modeling in cellular systems and is accessible also to theoreticians in biology and medicine
