The Theory of Search Games and Rendezvous Steve Alpern, Shmuel Gal, 2006-04-10 Search Theory is one of the original disciplines within the field of Operations Research It deals with the problem faced by a Searcher who wishes to minimize the time required to find a hidden object or target The Searcher chooses a path in the search space and

finds the target when he is sufficiently close to it. Traditionally the target is assumed to have no motives of its own regarding when it is found; it is simply stationary and hidden according to a known distribution. e.g. oil or its motion is determined stochastically by known rules. e.g. a fox in a forest. The problems dealt with in this book assume on the contrary that the target is an independent player of equal status to the Searcher who cares about when he is found. We consider two possible motives of the target and divide the book accordingly. Book I considers the zero sum game that results when the target here called the Hider does not want to be found. Such problems have been called Search Games with the zero sum qualifier understood. Book II considers the opposite motive of the target namely that he wants to be found. In this case the Searcher and the Hider can be thought of as a team of agents simply called Player I and Player II with identical aims and the coordination problem they jointly face is called the Rendezvous Search Problem. *Electronic Learning*, 1984

The Game of Stars and Comets Andre Norton, 2009-04-01. Danger in the Stars: The birth of a hero is never easy. Clumsy as an elephant in high heels, he is nothing like his legendary scout father. But inside that bull moose of a body lies the heart of a hero whose moment has arrived. Next, a boy survives alien invasion but must learn to think and act like his reptilian enemy to exact retribution for slaughter. These and two other tales of coming of age through peril from the writer who invented the genre. Includes *The X Factor*, *Voorloper*, *The Eye of the Monster*, and *The Sioux Spaceman*, all set in Norton's Council Confederation universe. A Beautiful Math Tom Siegfried, 2006-09-21. Millions have seen the movie and thousands have read the book, but few have fully appreciated the mathematics developed by John Nash's beautiful mind. Today Nash's beautiful math has become a universal language for research in the social sciences and has infiltrated the realms of evolutionary biology, neuroscience, and even quantum physics. John Nash won the 1994 Nobel Prize in economics for pioneering research published in the 1950s on a new branch of mathematics known as game theory. At the time of Nash's early work, game theory was briefly popular among some mathematicians and Cold War analysts. But it remained obscure until the 1970s when evolutionary biologists began applying it to their work. In the 1980s, economists began to embrace game theory. Since then, it has found an ever-expanding repertoire of applications among a wide range of scientific disciplines. Today, neuroscientists peer into game players' brains, anthropologists play games with people from primitive cultures, biologists use games to explain the evolution of human language, and mathematicians exploit games to better understand social networks. A common thread connecting much of this research is its relevance to the ancient quest

for a science of human social behavior or a Code of Nature in the spirit of the fictional science of psychohistory described in the famous Foundation novels by the late Isaac Asimov In A Beautiful Math acclaimed science writer Tom Siegfried describes how game theory links the life sciences social sciences and physical sciences in a way that may bring Asimov's dream closer to reality
