Pharmaceutical Suspensions Alok K. Kulshreshtha, Onkar N. Singh, G. Michael Wall, 2009-11-05 The suspension dosage form has long been used for poorly soluble active ingredients for various therapeutic indications Development of stable suspensions over the shelf life of the drug product continues to be a challenge on many fronts A good understanding of the fundamentals of disperse systems is essential in the development of a suitable pharmaceutical suspension The development of a suspension dosage form follows a very complicated path The selection of the proper excipients surfactants viscosity imparting agents etc is important The

particle size distribution in the finished drug product dosage form is a critical parameter that significantly impacts the bioavailability and pharmacokinetics of the product. Appropriate analytical methodologies and instruments (chromatographs, viscometers, particle size analyzers etc.) must be utilized to properly characterize the suspension formulation. The development process continues with a successful scale up of the manufacturing process. Regulatory agencies around the world require clinical trials to establish the safety and efficacy of the drug product. All of this development work should culminate into a regulatory filing in accordance with the regulatory guidelines. Pharmaceutical Suspensions: From Formulation Development to Manufacturing in its organization follows the development approach used widely in the pharmaceutical industry. The primary focus of this book is on the classical dispersed system poorly soluble active pharmaceutical ingredients suspended in a suitable vehicle.

Block's Disinfection, Sterilization, and Preservation Gerald McDonnell, 2020-06-26 With more international contributors than ever before, Block's Disinfection, Sterilization and Preservation 6th Edition is the first new edition in nearly 20 years of the definitive technical manual for anyone involved in physical and chemical disinfection and sterilization methods. The book focuses on disease prevention rather than eradication and has been thoroughly updated with new information based on recent advances in the field and understanding of the risks, the technologies available and the regulatory environments.

Specialised Pharmaceutical Formulation Geoffrey D Tovey, 2022-05-04 Formulation is a key step in the drug design process where the active drug is combined with other substances that maximise the therapeutic potential, safety and stability of the final medicinal product. Regulatory and quality demands, in addition to advances in processing technologies, result in growing challenges as well as possibilities for the field. Following on from Pharmaceutical Formulation, which covered traditional dosage forms such as tablets and capsules, this volume expands upon those formulations to cover a more diverse range of less common dosage forms. Novel routes of administration are covered from inhalational, dermal and transdermal formulations to ocular, oral suspensions, vaccines and nanoparticle drug delivery. The methods through which these formulations are processed and manufactured is also covered, providing essential knowledge to ensure quality, efficiency and acceptable costing. Specialised Pharmaceutical Formulation is an essential up-to-date resource for students and researchers working in academia and in the pharmaceutical industry and will equip readers with the ability to effectively and reliably produce products which can be approved, manufactured and made available to administer to patients.

Update on Polymers for Ocular Drug Delivery Atish S Mundada, 2011-12-20 The eye is the most easily accessible site for topical administration of a medication Drugs are commonly applied to the eye for localised action on the surface or in the interior of the eye A major problem in ocular therapeutics is the attainment of an optimal drug concentration at the site of action Poor bioavailability of drugs from ocular dosage forms is mainly due to the precorneal loss factors which include tear dynamics non productive absorption transient residence time in the cul de sac and the relative impermeability of the corneal epithelial membrane Due to these physiological and anatomical constraints only a small fraction of the drug effectively 1% or even less of the instilled dose is ocularly absorbed The effective dose of medication administered ophthalmically may be altered by increasing the retention time of medication in contact with the surface of the eye To date Pharmaceutical Technologists have

tried to develop different novel formulations like gel ocular inserts collagen shields implants liposomes nanoparticles penetration enhancers and in situ gelling systems in order to increase the bioavailability and duration of the therapeutic action of ocular drugs and polymers plays an important role in all these approaches This book provides detailed information regarding all such polymers which have been used and shown to be excellent in improving the bioavailability of ocular drugs
