Transforming Growth Factor-Beta in Cancer Therapy, Volume II Sonia B. Jakowlew, 2010-01-01 Transforming Growth Factor B in Cancer Therapy Volume II Cancer Treatment and Therapy The chapters in this volume confer an abundance of knowledge about the current state of our understanding of transforming growth factor B TGF B in cancer treatment and therapy Unlike several more traditional positive polypeptide growth factors that stimulate cellular proliferation the prototypical TGF B is now known to inhibit the growth of most normal cell types including those of epithelial and mesenchymal origin However there are examples of cell types that can be stimulated by TGF B under certain conditions TGF B also induces the accumulation of matrix molecules by stimulating their synthesis as well as inhibiting their degradation Moreover TGF B induces apoptosis of certain cell types thereby restricting their proliferation Overactivity of TGF has been linked to several diseases For instance the effect of TGF on matrix accumulation contributes to fibrotic conditions like glomerulonephritis lung fibrosis and liver cirrhosis 1 TGF has a very complicated role in cancer that is only beginning to be understood

Deoxynucleoside Analogs in Cancer Therapy Godefridus J Peters,2007-11-07 Successful cancer chemotherapy relies heavily on the application of various deoxynucleoside analogs Since the very beginning of modern cancer chemotherapy a number of antimetabolites have been introduced into the clinic and subsequently applied widely for the treatment of many malignancies both solid tumors and hematological disorders In the latter diseases cytarabine has been the mainstay of treatment of acute myeloid leukemia Although many novel compounds were synthesized in the 1980s and 1990s no real improvement was made However novel technology is now capable of elucidating the molecular basis of several inborn errors as well as some specific malignancies This has enabled the synthesis of several deoxynucleoside analogs that could be applied for specific malignancies such as pentostatin and subsequently chlorodeoxyadenosine cladribine for the treatment of hairy cell leukemia Already in the early stage of deoxynucleoside analog development it was recognized that several of these compounds were very effective in the treatment of various viral infections such as for the treatment of herpes infections This formed the basis initially for the design of azidothymidine and subsequently many other analogs which are currently successfully used for the treatment of HIV infections As a spin off of these research lines some compounds not eligible for development as antiviral agents appeared to be very potent anticancer agents The classical example is gemcitabine now one of the most widely applied deoxynucleoside analogs used for the combination treatment of non small cell lung cancer pancreatic cancer bladder cancer and ovarian cancer
