

# The Hardy-Weinberg Equilibrium

How can we make predictions about the characteristics of a population?

## Why?

Punnett squares provide an easy way to predict the possible genotypes for an offspring, but it is not practical to perform a Punnett square analysis on all possible combinations of all members of a population to predict what the population might look like in the future. For that we must turn to statistics. The Hardy-Weinberg equation is a tool biologists use to make predictions about a population and to show whether or not evolution is occurring in that population.

## Model 1 – Controlled (Selective) Mating

1. How many mating pairs are illustrated in Model 1?

*There are twelve mating pairs.*

2. Describe the parents in each mating pair in Model 1. Use terms such as homozygous, heterozygous, dominant, and recessive.

*One parent is heterozygous and the other is homozygous recessive.*

3. Use two Punnett squares to determine the possible genotypes for offspring from the pairs.
