

Frog Heart

In this experiment, you will explore basic principles of cardiac muscle physiology by recording force of contraction and the electrocardiogram (ECG). You will examine the effects of temperature, stretch, drugs on the heart, and conduction blockade, on the frog heart *in situ*.

Background

Studies of isolated organs were pioneered in the late 19th century when scientists such as Sidney Ringer (1835-1916) developed perfusion solutions (such as Ringer's solution) based upon the composition of the extracellular fluid that could sustain an organ isolated from a pithed animal. A classic example of an isolated organ preparation is the frog heart. It will continue to beat *in situ* for several hours, during which basic cardiac functions can be investigated.

The heart is made up of cardiac muscle. Cardiac muscle is similar to skeletal (striated) muscle, but exhibits some special properties, the most important of which is rhythmicity. All cardiac muscle cells have the inherent ability to depolarize and repolarize. These action potentials spread to adjacent cells via gap junctions that allow ions to move; thus current flows from cell to cell. In this way the atria and the ventricles behave as electrical syncytia. These spontaneous cycles of depolarization and repolarization occur in rhythmic fashion, giving rise to an intrinsic, regular heartbeat. In the intact, normal heart, the heart rate is determined by the group of cells – the pacemaker cells – that undergo the fastest depolarization/repolarization cycle. In the mammalian heart, the pacemaker cells are located in the sinoatrial (SA) node. In the frog heart, the sinus venosus is the functional equivalent of the mammalian SA node (Figure 1).

Figure 1. Ventral and Dorsal Views of the Frog Heart

As well as cell-to-cell current flow, there is a specialized conduction pathway. This provides the only electrical connection between the atria and ventricles – the AV node. Although there are pacemaker cells here, conduction is much slower than it is through either atrial or ventricular muscle. This allows the depolarization of the atria (and
