

Lab 09 – pH and Buffers

A. Objectives:

1. Constructive proper titration and titration curve.
2. Understand and explain how the pH scale works.
3. Understand and describe the concept of acids, bases, and strength.
4. Compare acids and bases in terms of strength.
5. Calculate the pH of various acids/bases/solutions.
6. Calculate equilibrium pH, structure, and concentration of acids and bases.

B. Background: Titration, Equilibrium and Coupling

1. Titration:

Chemical titration is a quantitative method for determining the concentration of a solution containing a known volume of a substance. It involves the addition of a known volume of a solution of a known concentration to a solution of a known concentration.

2. Equilibrium and Titration: A titration is a process by which a solution of a known concentration is added to a solution of a known concentration until the reaction is complete. The endpoint of the titration is the point at which the reaction is complete. The endpoint is determined by the color change of the indicator. The indicator is a substance that changes color at the endpoint of the titration.

3. Buffering: A buffer is a solution that resists changes in pH. It is a solution that contains a weak acid and its conjugate base. The buffer capacity is the amount of acid or base that can be added to the buffer without causing a significant change in pH.

4. pH: The pH of a solution is a measure of its acidity. It is defined as the negative logarithm of the concentration of hydrogen ions in the solution.
