Hydrophobic and Superhydrophobic Organic-Inorganic Nano-Hybrids Chang-Sik Ha, Saravanan Nagappan, 2018-03-22 In materials chemistry hybrid systems have become popular because of their enhanced properties compared to their individual components Organic inorganic hybrid materials have dual enhanced chemical thermal and

mechanical properties of both organic and inorganic materials in a single material and are used in various applications. An enhanced hybrid material has many technical advantages compared to single organic or inorganic materials. These technical advantages and the applications of organic inorganic hybrid materials have been covered by several scientific papers, reviews, and books. This book, however, exclusively covers hydrophobic and superhydrophobic surfaces based on organic inorganic nanohybrids, their synthesis and fabrication, and their recent and potential applications in various fields. The book is a good reference for understanding the surface properties of organic inorganic nanohybrids and also a valuable guide for college, high school, undergraduate, and graduate students and scientists with a background in chemistry, chemical engineering, materials science, and engineering, nanotechnology, surface science, and engineering or industrial coatings.

Nanofabrication Ampere A. Tseng, 2008. Many of the devices and systems used in modern industry are becoming progressively smaller and have reached the nanoscale domain. Nanofabrication aims at building nanoscale structures which can act as components, devices, or systems in large quantities at potentially low cost. Nanofabrication is vital to all nanotechnology fields, especially for the realization of nanotechnology that involves the traditional areas across engineering and science. This is the first book solely dedicated to the manufacturing technology in nanoscale structures, devices, and systems and is designed to satisfy the growing demands of researchers, professionals, and graduate students. Both conventional and non-conventional fabrication technologies are introduced with emphasis on multidisciplinary principles, methodologies, and practical applications. While conventional technologies consider the emerging techniques developed for next-generation lithography, non-conventional techniques include scanning probe microscopy, lithography, self-assembly, and imprint lithography, as well as techniques specifically developed for making carbon tubes and molecular circuits and devices.
