Inorganic Chemistry Catherine E. Housecroft, A. G. Sharpe, 2012

Inorganic Chemistry Catherine E. Housecroft, 2005

This updated solutions manual contains detailed worked solutions to the problems contained in the second edition of Inorganic Chemistry. Key features: Addition of new problems including overview problems to each chapter. Bullet point essay plans. General notes giving further explanation of particular topics and tips on completing problems. Cross references to main text and to other relevant problems. Margin notes for guidance. High quality graphs, structures and diagrams. Includes Periodic Table and Table of Physical Constants for reference. This manual is a useful tool in helping students to grasp problem solving skills and should prove invaluable to both lecturers and students who are using the main Inorganic Chemistry text.

Principles of Inorganic Chemistry Brian W. Pfennig, 2015-03-03. Aimed at senior undergraduates and first year graduate students, this book offers a principles based approach to inorganic chemistry that unlike other texts uses chemical applications of group theory and molecular orbital theory throughout as an underlying framework. This highly physical approach allows students to derive the greatest benefit of topics such as molecular orbital acid base theory, band theory of solids and inorganic photochemistry, to name a few. Takes a principles based group and molecular orbital theory approach to inorganic chemistry. The first inorganic chemistry textbook to provide a thorough treatment of group theory, a topic usually relegated to only one or two chapters of texts, giving it only a cursory overview. Covers atomic and molecular term symbols, symmetry, coordinates in vibrational spectroscopy using the projection operator method, polyatomic MO theory, band theory and Tanabe Sugano diagrams. Includes a heavy dose of group theory in the primary inorganic textbook, most of the pedagogical benefits of integration and reinforcement of this material in the treatment of other topics such as frontier MO, acid base theory, band theory of solids, inorganic photochemistry, the Jahn Teller effect and Wade's rules are fully realized. Very physical in nature, compare to other textbooks in the field, taking the time to go through mathematical derivations and to compare and contrast different theories of bonding in order to allow for a more rigorous treatment of their application to molecular structure, bonding and spectroscopy. Informal and engaging writing style, worked examples throughout the text, unanswered problems in every chapter, contains a generous use of informative, colorful illustrations.
