Photoelectrochemical Hydrogen Production Roel van de Krol, Michael Grätzel, 2011-11-09 Photoelectrochemical Hydrogen Production describes the principles and materials challenges for the conversion of sunlight into hydrogen through water splitting at a semiconducting electrode. Readers will find an analysis of the solid-state properties and materials requirements for semiconducting photoelectrodes, a detailed description of the semiconductor-electrolyte interface in addition to the photoelectrochemical PEC cell. Experimental techniques to investigate both materials and PEC device performance are outlined, followed by an overview of the current state of the art in PEC materials and devices and combinatorial approaches towards the development of new materials. Finally, the economic and business perspectives of PEC devices are discussed and promising future directions indicated. Photoelectrochemical Hydrogen Production is a one-stop resource for scientists, students, and R&D practitioners starting in this field, providing both the theoretical background as well as useful practical information on photoelectrochemical measurement techniques. Experts in the field benefit from the chapters on current state of the art, materials, devices, and future directions.

Surface Science Kurt W. Kolasinski, 2019-11-26 An updated fourth edition of the text that provides an understanding of chemical transformations and the formation of structures at surfaces. The revised and enhanced fourth edition of Surface Science covers all the essential techniques and phenomena that are relevant to the field. The text elucidates the structural, dynamical, thermodynamic, and kinetic principles concentrating on gas-solid and liquid-solid interfaces. These principles allow for an understanding of how and why chemical transformations occur at surfaces. The author, a noted expert on in the field, combines the required chemistry, physics, and mathematics to create a text that is accessible and comprehensive. The fourth edition incorporates new end-of-chapter exercises, the solutions to which are available online to demonstrate how problem-solving that is relevant to surface science should be performed. Each chapter begins with simple principles and builds to more advanced ones. The advanced topics provide material beyond the introductory level and highlight some frontier areas of study. This updated new edition contains an expanded treatment of STM and AFM as well as super-resolution microscopy. Reviews advances in the theoretical basis of catalysis and the use of activity descriptors for rational catalyst design. Extends the discussion of two-dimensional solids to reflect remarkable advances in their growth and characterization. Delves deeper into the surface science of electrochemistry and charge transfer.
