Mathematical Methods in Quantum Mechanics Gerald Teschl, 2009 Quantum mechanics and the theory of operators on Hilbert space have been deeply linked since their beginnings in the early twentieth century States of a quantum system correspond to certain elements of the configuration space and observables correspond to certain operators on the space This book is a brief but self contained introduction to the mathematical methods of quantum mechanics with a view towards applications to Schrodinger operators Part 1 of the book is a concise introduction to the spectral theory of unbounded operators Only those topics that will be needed for later applications are covered The spectral theorem is a central topic in this approach and is introduced at an early stage Part 2 starts with the free Schrodinger equation and computes the free resolvent and time evolution Position momentum and angular momentum are discussed via algebraic methods Various mathematical methods are developed which are then used to compute the spectrum of the hydrogen atom Further topics include the nondegeneracy of the ground state spectra of atoms and scattering theory This book serves as a self contained introduction to spectral theory of unbounded operators in Hilbert space with full proofs and minimal prerequisites Only a solid knowledge of advanced calculus and a one semester introduction to complex analysis are required In particular no functional analysis and no Lebesgue integration theory are assumed It develops the mathematical tools necessary to prove some key results in nonrelativistic quantum mechanics *Mathematical Methods in Quantum Mechanics* is intended for beginning graduate students in both mathematics and physics and provides a solid foundation for reading more advanced books and current research literature It is well suited for self study and includes numerous exercises many with hints
