Bridging the Gap between Machine Learning and Affective Computing Zhen Cui, Abhinav Dhall, Xiaopeng Hong, Yong Li, Wenming Zheng, Yuan Zong, 2023-01-05. Affective computing refers to computing that relates to, arises from, or influences emotions, as pioneered by Rosalind Picard in 1995. The goal of affective computing is to bridge the gap between human and machines and ultimately enable robots to communicate with humans naturally and emotionally. Recently, the research on affective computing has gained considerable progress with many fields contributing, including neuroscience, psychology, education, medicine, behavior, sociology, and computer science. Current research in affective computing mainly focuses on estimating human emotions through different forms of signals, e.g., face, video, EEG, speech, PET scans, or fMRI. Inferring the emotion of humans is difficult as emotion is a subjective, unconscious experience characterized primarily by psychophysiological expressions and biological reactions. It is influenced by hormones and neurotransmitters such as dopamine, noradrenaline, serotonin, oxytocin, GABA, etc. The physiology of emotion is closely linked to arousal of the nervous system with various states and strengths relating apparently to different particular emotions. To understand emotion or affect merely by machine learning or big data analysis is not enough, but the understanding and applications from the intrinsic features of emotions from the neuroscience aspect is essential.
