Microbial Metabolic Activities - C04: 21 Lecture 11

Microorganisms

How does a cell utilize the resources within their system efficiently to produce the products?
How does a cell utilize their energy for their metabolism?

A. Principles of Transcription

1. Transcription has been known since the 1950s **transcription of DNA**
and **transcription** is a process through which the **genetic information** encoded in the **genome** is **copied** into **mRNA** that can be **translated** into **protein**. This process occurs **in the nucleus**. Two essential molecules are involved in this process: **RNA polymerase**.

2. In the early transcription process, the **RNA polymerase** binds to the **promoter** and **initiates** the **transcription** process. The **promoter** is a region of DNA that is **upstream** of the **gene** and is **responsible** for **initiating** the **transcription** process.

3. In the next step, the **RNA polymerase** synthesizes **mRNA** which is then **translated** into **protein**. The **translation** process occurs in the **cytoplasm** and is **responsible** for **producing** the **protein** products.

4. From the **mRNA** sequence, the **ribosome** can **translate** the **information** into **protein**. The **ribosome** is a complex of **ribosomal RNA** and **proteins** that is **responsible** for **translating** the **mRNA** into **protein**. The **ribosome** is **located** in the **cytoplasm** and is **responsible** for **producing** the **protein** products.

5. Transcription and translation are **essential** processes for **cellular** function. Without **transcription**, the **genetic information** would not be **expressed** and the **cell** would not be able to **synthesize** the **proteins** that are **needed** for **cellular** function.

B. Characteristics and Progression of Transcription

1. In the next step, the **RNA polymerase** synthesizes **mRNA**. The **transcription** process is **unidirectional** and **asynchronous**. The **transcription** process is **unidirectional** because the **RNA polymerase** can only **synthesize** **mRNA** in one **direction**. The **transcription** process is **asynchronous** because the **RNA polymerase** can **synthesize** **mRNA** at **different** **rates** and **times**.

2. The **transcription** process is **regulated** by **transcription factors**. These **factors** are **proteins** that **bind** to **specific** **regions** of the **DNA** and **regulate** the **transcription** process. The **transcription factors** are **responsible** for **controlling** the **transcription** process and **ensuring** that the **correct** **mRNA** is **synthesized**.
