Williams,Barbara E. Moore,Michael Ibarra,TEXAS UNIV AT SAN ANTONIO CENTER FOR APPLIED RESEARCH AND TECHNOLOGY.,1979 The purpose of this study was to determine the effects of a disinfectant on the membrane surface and to determine the bactericidal efficiencies of several disinfectants on organisms found on the membrane surface This information may help evaluate whether field disinfection of an RI unit is practicable for prolongation of service The first direction studied the chemical effects of several iodine concentrations as a

suitable disinfectant on polyamide and polycellulose special wound membranes in 2000 hour static immersion tests The second direction studied and compared the bactericidal efficiency of iodine iodine bromide and chlorine on the test organisms The organisms employed *Pseudomonas fluorescens* *Pseudomonas aeruginosa* and *Escherichia coli* were isolated from a polyamide membrane subjected to field test conditions by USAMERADCOM personnel and were determined to be the most prevalent organisms The major conclusions derived from this study are 1 *P. aeruginosa* *P. fluorescens* and *E. coli* are the predominant microbiological agents on fouled polyamide membranes Potomac River water test site and these organisms can be isolated identified and cultured 2 There is significant polyamide membrane deterioration upon immersion of the membrane in a static test system The deterioration is evidenced by the appearance of holes of various sizes in the surface These structural abnormalities appear after 45 days immersion in either a 1 or 5 mg 1 iodine solution 3 The organisms *P. aeruginosa* and *P. fluorescens* are more resistant than *E. coli* to inactivation using either iodine iodine bromide or chlorine as the disinfectant

Reverse Osmosis S. Sourirajan,1970 The reverse osmosis process is discussed with particular reference to systems involving aqueous solutions and Loeb Sourirajan type porous cellulose acetate membranes Mechanisms of the process and

porous cellulose acetate membrane technology are briefly reviewed Based on a general capillary diffusion model for the transport of solvent and solute through the membrane transport equations applicable for the entire range of solute separation are presented The results of the analysis and correlations of experimental reverse osmosis data are illustrated On the basis of the above equations and correlations methods of membrane specification expressing membrane selectivity and predicting membrane performance are outlined Reverse osmosis is then treated as a unit operation in chemical engineering A set of general equations for reverse osmosis process design is then derived for reverse osmosis systems specified in terms of membrane specifications and operating conditions Author
