Ecology, Environmental Science and Conservation 2nd Edition JS Singh | SP Singh | SR Gupta | Rishikesh Singh, The updated second edition of the book offers an innovative synthesis of fundamental ecological concepts and practical applications in environmental science and conservation It is the first textbook on the subject by eminent Indian researchers and presents most of the examples from the Indian subcontinent The book covers a wide range of topics including fundamental concepts required to comprehend the physical environment population dynamics community characteristics patterns and gradients in biodiversity ecosystem functioning and dynamics and the study of biogeography It also addresses applied topics such as environmental pollution impact assessment natural resource management biodiversity conservation ecosystem services global climate change ecosystem restoration urban ecology and sustainable development The main issues are discussed

within the sustainability framework considering humans as part of ecosystems and recognising that sustainable development requires the integration of ecology with social sciences for policy formulation and implementation The updated edition of the book aligns with the National Education Policy 2020 and the revised UGC Guidelines It aims to meet the needs of students in basic and multidisciplinary courses in ecology and environmental science as well as professionals in agriculture forestry and geography at both the graduate and postgraduate levels **Nitrogen in the Marine Environment** Douglas G.

Capone, Deborah A. Bronk, Margaret R. Mulholland, Edward J. Carpenter, 2008-08-01 Since the first edition of Nitrogen in the Marine Environment was published in 1983 it has been recognized as the standard in the field In the time since the book first appeared there has been tremendous growth in the field with unprecedented discoveries over the past decade that have fundamentally changed the view of the marine nitrogen cycle As a result this Second Edition contains twice the amount of information that the first edition contained This updated edition is now available online offering searchability and instant multi user access to this important information The classic text fully updated to reflect the rapid pace of discovery Provides researchers and students in oceanography chemistry and marine ecology an understanding of the marine nitrogen cycle Available online with easy access and search the information you need when you need it *Earth, Our Living Planet* Philippe Bertrand, Louis Legendre, 2021-04-21 Earth is to our knowledge the only life bearing body in the Solar System This extraordinary characteristic dates back almost 4 billion years How to explain that Earth is teeming with organisms and that this has lasted for so long What makes Earth different from its sister planets Mars and Venus The habitability of a planet is its capacity to allow the emergence of organisms What astronomical and geological conditions concurred to make Earth habitable 4 billion years ago and how has it remained habitable since What have been the respective roles of non biological and biological characteristics in maintaining the habitability of Earth This unique book answers the above questions by considering the roles of organisms and ecosystems in the Earth System which is made of the non living and living components of the planet Organisms have progressively occupied all the habitats of the planet diversifying into countless life forms and developing enormous biomasses over the past 3.6 billion years In this way organisms and ecosystems took over the Earth System and thus became major agents in its regulation and global evolution There was co evolution of the different components of the Earth System leading to a number of feedback mechanisms that regulated long term Earth conditions For millennia and especially since the Industrial Revolution nearly 300 years ago humans have gradually transformed the Earth System Technological developments combined with the large increase in human population have led in recent decades to major changes in the Earth's climate soils biodiversity and quality of air and water After some successes in the 20th century at preventing internationally environmental disasters human societies are now facing major challenges arising from climate change Some of these challenges are short term and others concern the thousand year evolution of the Earth's climate Humans should become the stewards of Earth The Living Ocean Boyce Thorne-Miller, 1999 The first edition of The Living

Ocean published in 1991 by Island Press in association with Friends of the Earth was widely praised by scientists policymakers instructors and general readers as a useful and accessible introduction to the science and policy of biological diversity in marine environments Since that time much new research has been conducted and numerous national and international policy initiatives have been undertaken With 1998 designated by the United Nations as the International Year of the Ocean this new revised and expanded edition is a welcome and much needed addition to the literature This edition brings the volume up to date and re establishes it as an essential primer for anyone wishing to gain an understanding of marine biodiversity and how it can be protected It provides an overview of basic concepts and principles and a review of relevant policy issues and existing instruments The author defines biological diversity and discusses the importance of threats to marine biodiversity reviews the current status of scientific knowledge describes the major coastal and oceanic ecosystem types and addresses the major threats in each presents a general discussion of the ways in which government and the public can protect marine biological diversity provides specific examples of national and international policies legal instruments programs and institutions addresses how social economic political and ethical considerations affect decisions to conserve marine biological diversity considers the involvement of citizens in developing ocean policy The book also includes a useful glossary that provides information about basic biological concepts and a comprehensive bibliography Throughout the author emphasizes the relationship of human societies and governments to the living ocean and the need to implement programs that will protect ecosystems and species

The Mediterranean Sea in the Era of Global Change 2 Christophe

Migon,Paul Nival,Antoine Sciandra,2020-04-28 Due to its particular characteristics the Mediterranean Sea is often viewed as a microcosm of the World Ocean Its proportionally reduced dimensions and peculiar hydrological circulation render it susceptible to environmental and climatic constraints which are rapidly evolving The Mediterranean is therefore an ideal site to examine in order to better understand a number of key oceanographic phenomena This is especially true of the Ligurian Sea where due to its geology oceanic conditions are found close to the coast As such 30 years ago an offshore time series site provided a fresh impetus to a long history of marine biology research which has generated a very important body of data and knowledge This is the second volume in a two volume series that summarizes this research Across these two books the reader will find 13 chapters that examine the geology physics chemistry and biology of the Ligurian Sea always with the goal of providing key elements of oceanography in a changing world

Nitrous Oxide and Climate Change Keith Smith, 2010 Nitrous oxide N₂O is the third most important in global warming terms of the greenhouse gases after carbon dioxide and methane As this book describes although it only comprises 320 parts per billion of the earth's atmosphere it has a so called Global Warming Potential nearly 300 times greater than that of carbon dioxide N₂O emissions are difficult to estimate because they are predominantly biogenic in origin The N₂O is formed in soils and oceans throughout the world by the microbial processes of nitrification and denitrification that utilise the reactive N compounds ammonium and nitrate respectively These forms of nitrogen are released during the natural biogeochemical nitrogen cycle but are also released by human activity In fact the quantity of these compounds entering the biosphere has virtually doubled since the beginning of the industrial age and this increase has been matched by a corresponding increase in N₂O emissions The largest source is now agriculture driven mainly by the use of synthetic nitrogen fertilisers The other major diffuse source derives from release of NO_x into the atmosphere from fossil fuel combustion and biomass burning as well as ammonia from livestock manure Some N₂O also comes directly from combustion and from two processes in the chemical industry the production of nitric acid and the production of adipic acid used in nylon manufacture Action is being taken to curb the industrial point source emissions of N₂O but measures to limit or reduce agricultural emissions are inherently more difficult to devise As we enter an era in which measures are being explored to reduce fossil fuel use and or capture or sequester the CO₂ emissions from the fuel it is likely that the relative importance of N₂O in the Kyoto basket of greenhouse gases will increase because comparable mitigation measures for N₂O are inherently more difficult and because expansion of the land area devoted to crops to feed the increasing global population and to accommodate the current development of biofuels is likely to lead to an increase in N fertiliser use and thus N₂O emission worldwide The aim of this book is to provide a synthesis of scientific information on the primary sources and sinks of nitrous oxide and an assessment of likely trends in atmospheric concentrations over the next century and the potential for mitigation measures Publisher's description
