The oceans are our planet's most distinctive and imposing natural habitat They cover 71 per cent of its surface support a remarkably diverse and exquisitely adapted array of life forms from microscopic viruses bacteria and plankton to the largest existing animals and possess many of Earth's most significant intriguing and inaccessible ecosystems In an era in which humans are significantly altering the global environment the oceans are undergoing rapid and profound changes The study of marine biology is thus taking on added importance and urgency as people struggle to understand and manage these changes to protect our marine ecosystems Healthy oceans produce half of the oxygen we breathe stabilize our climate create ecosystems that protect our coasts from storms provide us with abundant food and host diverse organisms that provide us with natural products for medicine and biotechnology In this Very Short Introduction marine biologist Philip Mladenov provides an accessible and up to date overview of marine biology offering a tour of marine life and marine processes that ranges from the unimaginably abundant microscopic organisms that drive the oceans food web to the apex predators that we exploit for food from polar ocean ecosystems to tropical coral reefs and from the luxurious kelp beds of the coastal ocean to deep ocean hydrothermal vents where life exists without the energy of the sun Throughout the book he considers the human impacts on marine life including overfishing plastic and nutrient pollution the spread of exotic species and ocean warming and acidification He discusses the threats these pose to our welfare and the actions required to put us on a path to a more sustainable relationship with our oceans so that they can be restored and protected for future generations Mladenov concludes with a new chapter offering an inspiring vision for the future of our oceans in 2050 that can be realised if we are wise enough to accelerate actions already underway and be bold with implementing new approaches The next decade will

decide the state of the oceans that we leave behind for future generations ABOUT THE SERIES The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area These pocket sized books are the perfect way to get ahead in a new subject quickly Our expert authors combine facts analysis perspective new ideas and enthusiasm to make interesting and challenging topics highly readable **Oceans: A Very Short Introduction** Dorrik Stow,2018-01-25 The importance of the oceans to life on Earth cannot be overstated Liquid water covers more than 70% of our planet s surface and in past geological time has spread over 85% Life on Earth began in the oceans over 3 5 billion years ago and remained there for the great majority of that time Today the seas still provide 99% of habitable living space the largest repository of biomass and holds the greatest number of undiscovered species on the planet Our oceans are vital for the regulation of climate and with global warming and decreasing land area they have become increasingly important as the source of food energy in the form of oil and gas and for their mineral wealth Oceans also form a key part of the biogeochemical cycles of carbon nitrogen and other elements critical to life Nutrients in upwelling areas are spread by ocean currents and the plankton of the seas supports a wealth of wildlife In this Very Short Introduction Dorrik Stow analyses these most important components of our blue planet and considers their relationship with and exploitation by humans He shows how the oceans are an essential resource to our overpopulated world and discusses why exploration and greater scientific understanding of the oceans their chemistry and their mineral wealth are now a high priority Stow also explores what we know of how oceans originate and evolve and change the shape of the seafloor and nature of its cover the physical processes that stir the waters and mix such a rich chemical broth and the inseparable link between oceans and climate As polar ice melts and sea levels rise countless millions who have made their homes on low lying lands close to the sea are threatened As scientific exploration of the seas gathers pace the new knowledge gained of the ocean Earth systems and their interaction with the human environment is vital to our understanding of how we can preserve these ultimately fragile environments ABOUT THE SERIES The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area These pocket sized books are the perfect way to get ahead in a new subject quickly Our expert authors combine facts analysis perspective new ideas and enthusiasm to make interesting and challenging topics highly readable

Conservation Biology for All Navjot S. Sodhi, Paul R. Ehrlich, 2010-01-07 Conservation Biology for All provides cutting edge but basic conservation science to a global readership A series of authoritative chapters have been written by the top names in conservation biology with the principal aim of disseminating cutting edge conservation knowledge as widely as possible Important topics such as balancing conservation and human needs climate change conservation planning designing and analyzing conservation research ecosystem services endangered species management extinctions fire habitat loss and invasive species are covered Numerous textboxes describing additional relevant material or case studies are also included The global biodiversity crisis is now unstoppable

what can be saved in the developing world will require an educated constituency in both the developing and developed world Habitat loss is particularly acute in developing countries which is of special concern because it tends to be these locations where the greatest species diversity and richest centres of endemism are to be found Sadly developing world conservation scientists have found it difficult to access an authoritative textbook which is particularly ironic since it is these countries where the potential benefits of knowledge application are greatest There is now an urgent need to educate the next generation of scientists in developing countries so that they are in a better position to protect their natural resources

Lakes Warwick F. Vincent, 2018 Ranging from vast inland seas to hydro reservoirs lakes are unique complex ecosystems Warwick Vincent introduces lake science or limnology and the importance of protecting and sustaining these vitally important living resources He explains the impact of factors such as climate seasons salinity and sedimentation on lake biodiversity Conservation Biology Peggy L. Fiedler, Peter M. Kareiva, 2012-12-06 Reflecting what a new generation of conservation biologists is doing and thinking this vital and far ranging second edition explores where conservation biology is heading It challenges many conventions of conservation biology by exposing certain weaknesses of widely accepted principles Combining contributions from both the school and the new breed of conservation biologists this insightful text focuses primarily on topics that are integral to the daily activities of conservation biologists Several chapters address ecosystem restoration and biotic invasions as well as the mechanics of population viability analyses which are now a routine facet of conservation efforts A case history approach is implemented throughout the book with the use of practical real world examples Furthermore an in depth look at quantitative analyses is presented allowing for models and mathematical analyses to pinpoint limitations in existing data and guide research toward those aspects of biology that are most likely to be critical to the dynamics of a species or an ecosystem **Geographical Review**, 1925
