**SHORT ANSWER** Answer the following questions in the space provided.

1. Name the type of energy that is a measure of strength for each of the following types of bonds:

|                                             |                         |
|---------------------------------------------|-------------------------|
| _____ <b>lattice energy</b> _____           | <b>a.</b> ionic bond    |
| _____ <b>bond energy</b> _____              | <b>b.</b> covalent bond |
| _____ <b>enthalpy of vaporization</b> _____ | <b>c.</b> metallic bond |

2. Use the electronegativity values shown in **Figure 20**, on page 161 of the text, to determine whether each of the following bonds is nonpolar covalent, polar covalent, or ionic.

|                                   |                 |                                      |               |
|-----------------------------------|-----------------|--------------------------------------|---------------|
| _____ <b>ionic</b> _____          | <b>a.</b> H—F   | _____ <b>nonpolar covalent</b> _____ | <b>d.</b> H—H |
| _____ <b>ionic</b> _____          | <b>b.</b> Na—Cl | _____ <b>polar covalent</b> _____    | <b>e.</b> H—C |
| _____ <b>polar covalent</b> _____ | <b>c.</b> H—O   | _____ <b>polar covalent</b> _____    | <b>f.</b> H—N |

3. How is a hydrogen bond different from an ionic or covalent bond?

A hydrogen bond is a dipole-dipole attraction between a partially positive hydrogen  
atom and the unshared electron pair of a strongly electronegative atom such as O,  
N, or F. Unlike ionic or covalent bonds, in which electrons are given up or shared,  
the hydrogen bond is a weaker attraction. Hydrogen bonds are generally  
intermolecular, while ionic and covalent bonds occur between ions or atoms  
respectively.

4. H<sub>2</sub>S and H<sub>2</sub>O have similar structures and their central atoms belong to the same group. Yet H<sub>2</sub>S is a gas at room temperature and H<sub>2</sub>O is a liquid. Use bonding principles to explain why this is.

Oxygen has higher electronegativity than sulfur, which creates a highly polar bond.  
Increased polarity in H<sub>2</sub>O bonds means a stronger intermolecular attraction, making  
water a liquid at room temperature. Hydrogen bonding exists between water  
molecules, but not between hydrogen sulfide molecules.
