Encyclopaedia of Groundwater Hydrology and Hydraulics Samuel Dixon, 2012-09 The hydrologic cycle is a constant movement of water above on and below the earth's surface It is a cycle that replenishes ground water supplies It begins as water vaporizes into the atmosphere from vegetation soil lakes rivers snowfields and oceans a process called evapotranspiration As the water vapour rises it condenses to form clouds that return water to the land through precipitation rain snow or hail Precipitation falls on the earth and either percolates into the soil or flows across the ground Usually it does both This edited volume explores this topic

Water Systems Analysis, Design, and Planning Mohammad Karamouz, 2021-12-28 This book presents three distinct pillars for analysis design and planning urban water cycle and variability as the state of water being landscape architecture as the medium for built by design and total systems as the planning approach The increasing demand for water and urban and industrial expansions have caused myriad environmental social economic and political predicaments More frequent and severe floods and droughts have changed the resiliency and ability of water infrastructure systems to operate and provide services to the public These concerns and issues have also changed the way we plan and manage our water resources Focusing on urban challenges and contexts the book provides foundational information regarding water science and engineering while also examining topics relating to urban stormwater water supply and wastewater infrastructures It also addresses critical emerging issues such as simulation and economic modeling flood resiliency environmental visualization satellite data applications and digital data model DEM advancements Features Explores various theoretical practical and real world applications of system analysis design and planning of urban water infrastructures Discusses hydrology hydraulics and basic laws of water flow movement through natural and constructed environments Describes a wide range of novel topics ranging from water assets water economics systems analysis risk reliability and disaster management Examines the details of hydrologic and hydrodynamic modeling and simulation of conceptual and data driven models Delineates flood resiliency environmental visualization pattern recognition and machine learning attributes Explores a compilation of tools and emerging techniques that elevate the reader to a higher

Water Resources Systems Planning and Management Sharad K. Jain, V.P. Singh, 2003-09-12 This book is divided into four parts The first part Preliminaries begins by introducing the basic theme of the book It provides an overview of the current status of water resources utilization the likely scenario of future demands and advantages and disadvantages of systems techniques An understanding of how the hydrological data are measured and processed is important before undertaking any analysis The discussion is extended to emerging techniques such as Remote Sensing GIS Artificial Neural Networks and Expert Systems The statistical tools for data analysis including commonly used probability distributions parameter estimation regression and correlation frequency analysis and time series analysis are discussed in a separate chapter Part 2 Decision Making is a bouquet of techniques organized in 4 chapters After discussing optimization and simulation the techniques of economic analysis are covered Recently environmental and social aspects and rehabilitation and resettlement of project affected people have come to occupy a central stage in water resources management and any good book is incomplete unless these topics are adequately covered The concept of rational decision making along with risk reliability and uncertainty aspects form subject matter of a chapter With these analytical tools the practitioner is well

equipped to take a rational decision for water resources utilization Part 3 deals with Water Resources Planning and Development This part discusses the concepts of planning the planning process integrated planning public involvement and reservoir sizing The last part focuses on Systems Operation and Management After a resource is developed it is essential to manage it in the best possible way Many dams around the world are losing some storage capacity every year due to sedimentation and therefore the assessment and management of reservoir sedimentation is described in details No analysis of water resources systems is complete without consideration of water quality A river basin is the natural unit in which water occurs The final chapter discusses various issues related to holistic management of a river basin
