### Answers to Odd-numbered Exercises

#### Chapter 1

- 1-3. (a) The coefficient of  $L_i$  represents the change in the percentage chance of making a putt when the length of the putt increases by one foot. In this case, the percentage chance of making the putt decreases by 4.1 for each foot longer the putt is.
- (b) The equations are identical. To convert one to the other, note that  $\hat{P}_i = P_i - e_i$ , which is true because  $e_i = P_i - \hat{P}_i$  (or more generally,  $e_i = Y_i - \hat{Y}_i$ ).
- (c) 42.6 percent, yes; 79.5 percent, no (too low); -18.9 percent, no (negative!).
- (d) One problem is that the theoretical relationship between the length of the putt and the percentage of putts made is almost surely non-linear in the variables; we'll discuss models appropriate to this problem in Chapter 7. A second problem is that the actual dependent variable is limited by zero and one but the regression estimate is not; we'll discuss models appropriate to this problem in Chapter 13.
- 1-5. (a)  $\beta_1$  is the change in  $S$  caused by a one-unit increase in  $Y$ , holding  $G$  constant and  $\beta_2$  is the change in  $S$  caused by a one-unit increase in  $G$ , holding  $Y$  constant.
- (b) +, -
- (c) Yes. Richer states spend at least some of their extra money on education, but states with rapidly growing student populations find it difficult to increase spending at the same rate as the student population, causing spending per student to fall, especially if you hold the wealth of the state constant.
- (d)  $\hat{S}_i = -183 + 0.1422Y_i + 59.26G_i$ . Note that  $59.26 \cdot 10 = 5926 = 0.10$ , so nothing in the equation has changed except the scale of the coefficient of  $G$ .
- 1-7. (a)  $\beta_1$  represents the impact on the wage of the  $i$ th worker of a one-year increase in the education of the  $i$ th worker, holding constant that worker's experience and gender.
- (b)  $\beta_1$  represents the impact on the wage of the  $i$ th worker of being male instead of female, holding constant that worker's experience and education.
- (c) There are two ways of defining such a dummy variable. You could define  $\beta_1$  as the impact on the wage of the  $i$ th worker if the worker is a person of color and 0 otherwise, or you could define  $\beta_1$  as the impact on the wage of the  $i$ th worker if the worker is not a person of color and 0 otherwise. (The actual name you use for the variable

**Modelling Under Risk and Uncertainty** Etienne de Rocquigny, 2012-04-12

Modelling has permeated virtually all areas of industrial environmental economic bio medical or civil engineering yet the use of models for decision making raises a number of issues to which this book is dedicated How uncertain is my model Is it truly valuable to support decision making What kind of decision can be truly supported and how can I handle residual uncertainty How much refined should the mathematical description be given the true data limitations Could the uncertainty be reduced through more data increased modeling investment or computational budget Should it be reduced now or later How robust is the analysis or the computational methods involved Should could those methods be more robust Does it make sense to handle uncertainty risk lack of knowledge variability or errors altogether How reasonable is the choice of probabilistic modeling for rare events How rare are the events to be considered How far does it make sense to handle extreme events and elaborate confidence figures Can I take advantage of expert phenomenological knowledge to tighten the probabilistic figures Are there connex domains that could provide models or inspiration for my problem Written by a leader at the crossroads of industry academia and engineering and based on decades of multi disciplinary field experience Modelling Under Risk and Uncertainty gives a self consistent introduction to the methods involved by any type of modeling development acknowledging the inevitable uncertainty and associated risks It goes beyond the black box view that some analysts modelers risk experts or statisticians develop on the underlying phenomenology of the environmental or industrial processes without valuing enough their physical properties and inner modelling potential nor challenging the practical plausibility of mathematical hypotheses

conversely it is also to attract environmental or engineering modellers to better handle model confidence issues through finer statistical and risk analysis material taking advantage of advanced scientific computing to face new regulations departing from deterministic design or support robust decision making
