large databases The enormous increase in the size of available scientific and commercial databases data avalanche as well as the continuing and exponential growth in performance of present day computers make data mining a very active field In many cases the burgeoning volume of data sets has grown so large that it threatens to overwhelm rather than enlighten scientists Therefore traditional methods are revised and streamlined complemented by many new methods to address challenging new problems Mathematical Programming plays a key role in this endeavor It helps us to formulate precise objectives e g a clustering criterion or a measure of discrimination as well as the constraints imposed on the solution e g find a partition a covering or a hierarchy in clustering It also provides powerful mathematical tools to build highly performing exact or approximate algorithms This book is based on lectures presented at the workshop on Data Mining and Mathematical Programming October 10 13 2006 Montreal and will be a valuable scientific source of information to faculty students and researchers in optimization data analysis and data mining as well as people working in computer science engineering and applied mathematics

Scientific Software Design Damian Rouson, Jim Xia, Xiaofeng Xu, 2011-04-29 The authors analyze how the structure of a package determines its developmental complexity according to such measures as bug search times and documentation information content The work presents arguments for why these issues impact solution cost and time more than does scalable performance The final chapter explores the question of scalable execution and shows how scalable design relates to scalable execution The book's focus is on program organization which has received considerable attention in the broader software engineering community where graphical description standards for modeling software structure and behavior have been developed by computer scientists These discussions might be enriched by engineers who write scientific codes This book aims to bring such scientific programmers into discussion with computer scientists The authors do so by introducing object oriented software design patterns in the context of scientific simulation

Relaxation and Decomposition Methods for Mixed Integer Nonlinear Programming Ivo Nowak, 2006-03-28 Nonlinear optimization problems containing both continuous and discrete variables are called mixed integer nonlinear programs MINLP Such problems arise in many fields such as process industry engineering design communications and finance There is currently a huge gap between MINLP and mixed integer linear programming MIP

solver technology With a modern state of the art MIP solver it is possible to solve models with millions of variables and constraints whereas the dimension of solvable MINLPs is often limited by a number that is smaller by three or four orders of magnitude It is theoretically possible to approximate a general MINLP by a MIP with arbitrary precision However good MIP approximations are usually much larger than the original problem Moreover the approximation of nonlinear functions by piecewise linear functions can be difficult and time consuming In this book relaxation and decomposition methods for solving nonconvex structured MINLPs are proposed In particular a generic branch and price BCP framework for MINLP is presented BCP is the underlying concept in almost all modern MIP solvers Providing a powerful decomposition framework for both sequential and parallel solvers it made the success of the current MIP technology possible So far generic BCP frameworks have been developed only for MIP for example COIN BCP IBM 2003 and ABACUS OREAS GmbH 1999 In order to generalize MIP BCP to MINLP BCP the following points have to be taken into account A given sparse MINLP is reformulated as a block separable program with linear coupling constraints The block structure makes it possible to generate Lagrangian cuts and to apply Lagrangian heuristics In order to facilitate the generation of polyhedral relaxations nonlinear convex relaxations are constructed The MINLP separation and pricing subproblems for generating cuts and columns are solved with specialized MINLP solvers
