

In this activity, we will use a representation of the atom in which a central nucleus containing the protons and neutrons is surrounded by circles that represent the energy levels electrons can occupy.

- 1) Draw an atom including a nucleus and five energy levels that electrons could occupy. Use a dot to represent an electron at the lowest energy level.

One way an atom emits light (photons) occurs when an electron drops down from a high energy level (also referred to as an excited state) to a lower energy level (the lowest energy level is referred to as the ground state.)

- 2) Will an atom emit light if all of the atom's electrons are in the ground state? Explain your reasoning.

No, if you are in the ground state, that is the lowest energy state and you cannot go any lower because there is no energy to give up.

- 3) In which case does an atom emit more energy (circle one)?

Case A: *An electron drops down from the first excited state to the ground state.*

Case B: *An electron drops down from the third excited state to the ground state.*

Explain your reasoning.

Each excited state has more and more energy, coming down from a higher energy state will release more energy.
