

1. Magnetism

- Only things made of iron/steel will stick to a magnet
- The force of magnetism is weaker when you put more distance between the magnet and the object it is trying to attract
- Induced magnetism happens when an iron/steel object is stuck to a permanent magnet. The object is induced (forced) to act like a magnet as long as it is in contact with the permanent magnet.
- Induced magnets behave (act) like magnets – they stick to iron/steel.

2. Circuit Vocabulary

- The D-cell is the **electric source**
- The light or the motor is the **electric receiver**
- The **switch opens and closes** the circuit
- **Closed circuits will allow electricity to flow** (lights light, motors run). Open circuits will NOT allow electricity to flow (no lights light, motors won't run)

3. Electric Circuits

- Electricity **leaves the negative end** of the battery and returns to the positive end – it flows in a **complete circle** called a circuit
- A complete circuit has a wire that touches the negative end and a wire that touches the positive end of a battery. If all the wires touch only one end, the circuit is NOT complete
- More than one D-cell (battery) can be in a circuit. However, the **opposite ends of the batteries must be connected to each other**. (negative to positive / positive to negative) If the batteries have the same end connected to each other, electricity will NOT flow
- Light bulbs give off light when their filaments get hot enough to glow. This happens because **thermal (heat) energy is created** when the electricity is flowing.
- Electric circuits produce a **magnetic force** while the electricity is flowing.
