Vectors, Tensors and the Basic Equations of Fluid Mechanics Rutherford Aris, 2012-08-28

Introduction to Quantum Nanotechnology Duncan G. Steel, 2021-04-30 Quantum is rapidly emerging as a game changer in technology The end of Moore's Law for exponential growth is rapidly approaching and engineers and physicist alike are looking at moving past the classical limitations of modern technology and are exploring the new opportunities that quantum behaviour creates in sensing metrology communications and information processing This book serves as introduction to quantum theory with emphasis on dynamical behaviour and applications of quantum mechanics with minimal discussion of formalism The goal is to help students begin to learn the tools for a quantum toolbox they will need to work in this area It is aimed at upper level undergraduates and first year graduate students and assumes the reader has not had any training in quantum mechanics beyond what might be encountered in two semesters of introductory physics The language of quantum is mathematics and builds on what is covered in typically the first two years The first six chapters introduce Schrödinger's equation and develop the quantized description of common systems that exist in real space like a vibrator nano particles atoms crystals etc Beginning in Ch 7 and for the remaining nine chapters the focus is primarily on dynamical behaviour and how to think about real quantum systems Spin the quantized electromagnetic field dissipation loss and spontaneous emission are discussed as well as quantum optics and the operator equations for common two state systems such as the quantum flip flop and the density matrix equations The book is structured so that a two semester course sequence is possible or a single semester course with options discussed in the preface to set different learning objectives Even a one semester course based on this text covers much more material than a typical upper quantum course for undergraduates in physics but at the expense of more detailed discussions about solutions to various differential equations

such as for angular momentum and the hydrogen atom or band theory for semiconductors
