Investigating Polynomials:

Arithmetical Investigations Shai M. J. Haran, 2008-04-25 In this volume the author further develops his philosophy of quantum interpolation between the real numbers and the p -adic numbers. The p -adic numbers contain the p -adic integers $\mathbb{Z}_p$ which are the inverse limit of the finite rings $\mathbb{Z}/p^n\mathbb{Z}$. This gives rise to a tree and probability measures w on $\mathbb{Z}_p$ correspond to Markov chains on this tree. From the tree structure one obtains a special basis for the Hilbert space $L^2(\mathbb{Z}_p, w)$. The real analogue of the p -adic integers is the interval $[0, 1]$ and a probability measure w on it gives rise to a special basis for $L^2([0, 1], w)$ the orthogonal polynomials and to a Markov chain on finite approximations of $[0, 1]$. For special gamma and beta measures there is a quantum or q -analogue Markov chain and a special basis that within certain limits yield the real and the p -adic theories. This idea can be generalized variously. In representation theory it is the quantum general linear group $GL_n(q)$ that interpolates between the p -adic group $GL_n(\mathbb{Z}_p)$ and between its real and complex analogue the orthogonal O_n and unitary U_n groups. There is a similar quantum interpolation between the real and p -adic Fourier transform and between the real and p -adic local unramified part of Tate thesis and Weil explicit sums.

Investigations of Field Dynamics in Laser Plasmas with Proton Imaging Thomas Sokollik, 2011-01-12 Laser driven proton beams are still in their infancy but already have some outstanding attributes compared to those produced in conventional accelerators. One such attribute is the typically low beam emittance. This allows excellent resolution in imaging applications like proton radiography. This thesis describes a novel imaging technique the proton streak camera that the author developed and first used to measure both the spatial and temporal evolution of ultra strong electrical fields in laser driven plasmas. Such investigations are of paramount importance for the understanding of laser plasma interactions and thus for optimization of laser driven particle acceleration. In particular the present work investigated micrometer sized spherical targets after laser irradiation. The confined geometry of plasmas and fields was found to influence the kinetic energy and spatial distribution of accelerated ions. This could be shown both in experimental radiography images and in numerical simulations one of which was selected for the cover page of Physical Review Letters.

Gust-tunnel Investigation of a Wing Model with Semichord Line Swept Back 60 Degrees Harold B. Pierce, 1950 An investigation was made in the Langley gust tunnel of a 60 degree sweptback wing model to determine its response to gusts On the basis of results a simplified method of analysis which uses a slope of the lift curve derived by the cosine law and which uses strip theory to estimate the penetration effect appears to be applicable for the prediction of gust loads on wings swept as much as 60 degrees

The Investigation of the Physical World Giuliano Toraldo di Francia, 1981-05-29 Originally published in Italian in 1976 this book describes the methods scientists use to investigate the physical world It is ideal for students and teachers of science and the philosophy of science It is both a high level popularization and a critical appraisal of these methods describing important advances in physics and analyzing the historical development value reliability and philosophical implications of the way physicists approach the problems confronting them The introductory chapter on the meaning of physical theories and the mathematical tools used to develop them is followed by a general discussion on the foundations of physics under four major headings the physics of the reversible the physics of the irreversible microphysics and cosmology Throughout the subject matter of physical theories is linked to discussion of the attendant philosophical and epistemological implications such as the validity of the theories inductive inference causal explanation probability the role of observation and the reality of physical objects

Selective for the Spatial Frequency of Disparity Modulation in Random-dot Stereograms Alan Blake Cobo-Lewis, 1992 The visual system must perform two major functions The first is resolving spatial layout and the second is object recognition Because we live in a three dimensional 3D world these tasks must be performed in three dimensions That is the visual system must assess 3D spatial layout and must recognize 3D objects There are two types of information sources that could be used to perform both functions Cues of the first type arise directly from characteristics of in the environment These include shape from shading depth from texture gradients and motion parallax due to movements of objects in the environment Cues of the second type arise from characteristics of the observer These include motion parallax due to movements of the observer through the environment and binocular disparity due to the relative positions of the two eyes This

paper is concerned with how the visual system processes the last cue binocular disparity Specifically it addresses the visual system's processing of binocular disparity across multiple spatial scales Research in Cryptology Frederik Armknecht, Stefan Lucks, 2012-10-06 This book constitutes the refereed proceedings of the 4th Western European Workshop on Research in Cryptology WEWoRC 2011 held in Weimar Germany in July 2011 The 10 revised full papers were carefully reviewed and selected from numerous submissions The papers span a wide spectrum of topics from foundations of cryptology up to secret key cryptosystems and hash functions public key cryptosystems modes of operation cryptographic protocols hardware and software implementation of cryptosystems and their integration into secure systems and applications such as watermarking and code obfuscation **Visual Complex Functions** Elias Wegert, 2012-08-30 This book provides a systematic introduction to functions of one complex variable Its novel feature is the consistent use of special color representations so called phase portraits which visualize functions as images on their domains Reading Visual Complex Functions requires no prerequisites except some basic knowledge of real calculus and plane geometry The text is self contained and covers all the main topics usually treated in a first course on complex analysis With separate chapters on various construction principles conformal mappings and Riemann surfaces it goes somewhat beyond a standard programme and leads the reader to more advanced themes In a second storyline running parallel to the course outlined above one learns how properties of complex functions are reflected in and can be read off from phase portraits The book contains more than 200 of these pictorial representations which endow individual faces to analytic functions Phase portraits enhance the intuitive understanding of concepts in complex analysis and are expected to be useful tools for anybody working with special functions even experienced researchers may be inspired by the pictures to new and challenging questions Visual Complex Functions may also serve as a companion to other texts or as a reference work for advanced readers who wish to know more about phase portraits **Approximation of Functions by Polynomials and Splines** S.
