s light detector interacts with the image focused upon it But of equal concern is the only partially understood and sometimes unexpected ways in which the human eye brain interprets this spectral stimulus as color The volume covers basic photographic subjects such as shutter aperture ISO metering and exposure value but also given their relations to the larger themes of the book less familiar topics such as the Jones Condit equation Lambertian versus isotropic reflections reflection and response curves and the opponent process model of color perception Although written at a beginning undergraduate level the topics are chosen for their role in a more general discussion of the relation between science and art that is of interest to readers of all backgrounds and levels of expertise
